<u>Drilling Program</u>

Permian Oilfield Partners LLC

Ramrod Fee SWD #1

SL: 323' FSL & 2227' FEL

Sec 17, T21S, R28E

Eddy County, New Mexico

Surface Hole

Hole size: 26"

Depth: 590'

Mud: Fresh water native spud mud. Need 28 to 36 visc. (mud weight not to exceed

8.8 ppg).

Drilling Parameters: Weld 30" drilling conductor with flow nipple onto the 30" conductor pipe at

surface. Notify NMOCD prior to spudding well *and* in sufficient time to witness cementing of surface casing. Run 26" bit, BHA and 5" DP to casing point. Seepage should be controllable with LCM sweeps. After drilling to 590', pump

heavy LCM sweep and circulate hole clean. TOOH to run csg.

Casing: From 0' to 590' – (20" 94# J55 BTC CSG)

Fill casing with drilling fluid as needed. Run 20" 94# J55 BTC casing with Texas

pattern guide shoe. Weld guide shoe and thread-lock bottom 2 joints.

Centralizers to go in the middle of the first joint, on the second coupling and the

fourth coupling.

Cement: Lead: 860 sks Class "C" + Additives

Yield - 1.75 cu ft/sk @ 13.5 ppg

Tail: 400 sks Class "C" + Additives

Yield – 1.33 cu ft/sk @ 14.8 ppg

Notify NMOCD in sufficient time to witness cementing of casing. After getting casing to TD, displace casing volume with the rig pump. RU cementers and cement as prescribed. If cement *does not* circulate, notify NMOCD. If cement *does* circulate, shut in head and WOC 8 hours before cutting off casing and

welding on a 20" diverter head.

Wellhead: 20" casing w/diverter head

First Intermediate Hole

Hole size: 18 ½"

Depth: 1188'

Mud: Saturated Brine with 29 to 31 visc. (Mud weight not to exceed 10.3 ppg).

Drilling Parameters: Ensure 20" diverter head is installed prior to TIH. WOC 8 hours total or until all

cement has reached 500 psi compressive strength as required by NMOCD before drilling cement or the plug. Run 18 ½" bit, BHA and 5" DP to casing point. Saturated brine water will be used to minimize washout in salt sections. Seepage should be controllable with LCM sweeps. After drilling to 1188', pump

heavy LCM sweep and circulate hole clean. TOOH to run csg.

Casing: From 0' to 1188' – (16" 75# J55 BTC CSG)

Fill casing with drilling fluid every 20 jts or less as needed. Run float shoe, 1 jt 16" 75# J55 BTC casing, float collar, & remainder jts 16" 75# J55 BTC casing to surface. **Thread - lock guide shoe and first 2 joints.** Centralizers will go in the middle of the first joint, on the second coupling and the fourth coupling. Float

equipment should be PDC drillable.

Cement: Lead: 417 sks Class "C" + Additives

Yield - 1.75 cu ft/sk @ 13.5 ppg

Tail: 200 sks Class "C" + Additives

Yield – 1.33 cu ft/sk @ 14.8 ppg

Notify NMOCD in sufficient time to witness cementing of casing. After getting casing to TD, displace casing volume with the rig pump. RU cementers and cement as per cement recommendation. If cement *does not* circulate, notify NMOCD. If cement does circulate, shut in head and WOC 8 hours before cutting

off casing and welding on a 16" diverter head.

Wellhead: 16" casing w/diverter head

Second Intermediate Hole

Hole size: 14 ¾"

Depth: 2695' *Adjust depth to "fit" hole for Cameron Speed Head*

Mud: Fresh water native mud. Need 28 to 36 visc. (mud weight not to exceed 8.8

ppg).

Drilling Parameters: Ensure 16" diverter head is installed prior to TIH. WOC 8 hours total or until all

cement has reached 500 psi compressive strength as required by NMOCD before drilling cement or the plug. Run 14 $\frac{3}{4}$ " bit, BHA and 5" DP to casing point. Seepage should be controllable with LCM sweeps. After drilling to 2695',

pump heavy LCM sweep and circulate hole clean. TOOH to run csg.

Casing: From 0' to 2695' – (13 3/8" 54.5# J55 FJ CSG)

(ECP/DV tool @ 1290' – Ensure 50' min below previous csg shoe)

Fill casing with drilling fluid every 20 jts or less as needed. Run float shoe, 1 jt 13 3/8" 54.5# J55 FJ casing, float collar, 1359' - 13 3/8" 54.5# J55 FJ casing, ECP/DV TOOL & remainder of 13 3/8" 54.5# J55 FJ casing to surface. Thread - lock guide shoe and first 2 joints. Run centralizers in the middle of 1st joint, top

of 2nd joint, then 4 centralizers alternating every other collar, then one

centralizer on joint below DV tool and one centralizer on joint above DV tool, for a total of 8 centralizers. Float equipment should be PDC drillable. Land 13 3/8"

casing with Cameron Speed Head using landing joint.

Cement:

Stage 1: Lead: 190 sks Class "C" + Additives

Yield – 1.75 cu ft/sk @ 13.5 ppg

Tail: 100 sks Class "H" + Additives

Yield – 1.33 cu ft/sk @ 14.8 ppg

ECP/DV TOOL @ 1290'

Stage 2: Lead: 232 sks Class "C" + Additives

Yield – 1.75 cu ft/sk @ 13.5 ppg

Tail: 100 sks Class "C" + Additives

Yield - 1.33 cu ft/sk @ 14.8 ppg

Notify NMOCD in sufficient time to witness cementing of casing. After getting casing to TD, displace casing volume with the rig pump. RU cementers and cement as per cement recommendation. If cement *does not* circulate, notify NMOCD. If cement *does* circulate, **WOC 8 hours** total or until all cement has reached 500 psi compressive strength as required by NMOCD before testing BOPE.

Wellhead: 13 %" 5K rated Cameron Speed Head

BOPE: 13 %" 10K rated triple ram BOP stack, 5K rated annular & rotating head.

BOPE Testing: WOC 8 hours or 500 psi compressive strength as required by NMOCD prior to

testing BOPE. Test BOP Rams to 5000 psi & Annular to 5000 psi with third

party.

Third Intermediate Hole

Hole size: 12 ¼"

Depth: 9356' *Adjust depth to "fit" hole for Cameron Speed Head*

Mud: Cut Brine 9.0 to 9.4 ppg, 29 to 34 visc. Mud weight not to exceed 10 ppg.

Drilling Parameters: Ensure 13 %" triple ram BOP stack, 5K rated annular & rotating head are NU &

Tested to 5000 psi. WOC 8 hours total or until all cement has reached 500 psi compressive strength as required by NMOCD before drilling cement or the plug. H_2S monitors and related safety equipment will be operational before drilling out 13 %" casing shoe. Run 12 %" bit, & BHA, with 5" DP back to surface. Prior to drilling any cement, test casing to 2150# for 30 mins with rig pump. Before drilling 20' into formation, perform a FIT to 10.0 ppg mud equivalent. Drill out with viscous cut brine and circulate through steel pits. Utilize mud cleaning equipment to keep fluid as clean as possible. Seepage should be controllable with LCM sweeps. After drilling to 9356', pump heavy LCM sweep and circulate

hole clean. TOOH to run csg.

Casing: From 0' to 9356' – (9 \(\frac{1}{2}\) 40# HCL80 BTC CSG)

(ECP/DV tool @ 2724' - Ensure 50' min below previous csg shoe)

Fill casing with drilling fluid every 20 jts or less as needed. Run float shoe, 1 jt 9 %" 40# HCL80 BTC casing, float collar, 6586' - 9 %" 40# HCL80 BTC casing, ECP/DV TOOL & remainder of 9 %" 40# HCL80 BTC casing to surface. Thread - lock guide shoe and first 2 joints. Run centralizers in the middle of 1st joint, top of 2nd joint, then 4 centralizers alternating every other collar, then one

centralizer on joint below DV tool and one centralizer on joint above DV tool, for a total of 8 centralizers. Float equipment should be PDC drillable. Land 9 5/8"

casing hanger in Cameron Speed Head using landing joint.

Cement:

<u>Stage 1:</u> Lead: 1207 sks Class "C" + Additives

Yield – 2.29 cu ft/sk @ 11.5 ppg

Tail: 400 sks Class "H" + Additives

Yield – 1.35 cu ft/sk @ 13.5 ppg

ECP/DV TOOL @ 2724'

Stage 2: Lead: 579 sks Class "C" + Additives

Yield – 2.26 cu ft/sk @ 11.5 ppg

Tail: 200 sks Class "C" + Additives

Yield – 1.33 cu ft/sk @ 14.8 ppg

Notify NMOCD in sufficient time to witness cementing of casing. After getting casing to TD, displace casing volume with the rig pump. RU cementers and cement as per recommendation. If cement *does not* circulate, notify NMOCD. If cement *does* circulate, WOC 8 hours or 500 psi compressive strength as required by NMOCD before drilling cement & plug.

Wellhead: 13 %" 5K rated Cameron Speed Head

BOPE: 13 %" 10K psi rated triple ram BOP stack, 5K psi rated annular & rotating head.

BOPE Testing: No BOPE Testing required due to using Cameron Speed Head

Fourth Intermediate Hole

Hole size: 8 ¾"

Depth: 12851'

Mud: Mud up to 11.8 to 12 ppg WBM as per mud recommendation. Mud properties

may have to be adjusted as needed for hole conditions.

Drilling Parameters: Ensure 13 %" 10K rated triple ram BOP stack, 5K rated annular & rotating head

are NU & Tested. Ensure super choke installed on choke manifold. WOC 8 hours total or until all cement has reached 500 psi compressive strength as required by NMOCD before drilling cement or the plug. Ensure H_2S monitors and related safety equipment are operational before drilling out shoe. PU 8 ¾" bit and BHA, with 5" drill pipe back to surface. NOTE: (ECP/DV Tool @ 2724'). Use caution when drilling DV tool & float equipment to avoid damaging bit. Test casing to 4100# for 30 mins with rig pump. Drill out with WBM and circulate through steel pits. Before drilling 20' into formation, perform a FIT to 12.0 ppg mud equivalent. Utilize mud cleaning equipment to keep fluid as clean as possible. When nearing the top of the Devonian formation, circulate samples up every 5'. After drilling to 12851', pump heavy LCM sweep and circulate hole

clean. TOOH to run csg.

Casing: 7 %" 39# HCL80 FJ CSG

TOL @ 9156'

Halliburton Versaflex Liner Hanger

Fill casing with drilling fluid every 20 jts or less as needed. Run float shoe, 10' jt 7 %" 39# HCL80 FJ, Float Collar, 10' jt 7 %" 39# HCL80 FJ, Halliburton Landing Collar & 3669' 7 %" 39# HCL80 FJ, 7 %" x 9 %" liner hanger & DP to surface. Set liner hanger to tie back minimum 100' inside 9 %" casing. Float equipment

should be PDC drillable.

Cement: 345 sks Class "C" + Additives

Yield - 1.62 cu ft/sk @ 14.5 ppg

Notify NMOCD in sufficient time to witness cementing of casing. After getting casing to TD, displace casing volume with the rig pump. RU cementers and cement as per recommendation. If cement *does not* circulate, notify NMOCD. If

cement *does* circulate, TOH w/liner hanger setting tool.

Wellhead: No Change in wellhead required

BOPE: 13 %" 10K psi rated triple ram BOP stack, 5K psi rated annular & rotating head.

BOPE Testing: No BOPE testing required as the stack was not broken

Production Hole

Hole size: $6 \frac{1}{2}$ "

Depth: 13530'

Mud: Cut Brine 8.4 to 8.6 ppg, 29 to 32 visc. Mud weight not to exceed 9.0 ppg. Mud

properties may have to be adjusted as needed for hole conditions.

Drilling Parameters: Ensure 13 %" 10K rated triple ram BOP stack, 5K rated annular & rotating head

are NU & Tested. WOC 8 hours total or until all cement has reached 500 psi compressive strength as required by NMOCD before drilling cement or the plug. Ensure H₂S monitors and related safety equipment are operational before drilling out 7 %" liner shoe. PU 6 ½" bit and BHA, with DP back to surface. Prior to drilling any cement, test casing to 4100# for 30 mins with rig pump. Use caution when drilling DV tool & float equipment to avoid damaging bit. Before drilling 20' into formation, perform a FIT to 9.0 ppg mud equivalent. Utilize mud cleaning equipment to keep fluid as clean as possible. After drilling to 13530' +/-, pump heavy LCM sweep and circulate hole clean. DO NOT DRILL

INTO MONTOYA FORMATION (CHERT RETURNS). TOOH to 7 %" casing shoe &

LDDP.

Completion

Logging: MIRU wireline truck & RIH w/open hole CNL/GR/PRESS/TEMP and cased hole

CBL w/CCL. Verify formation markers with drilled depth.

Packer Setting: PU Setting Tool, CCL & 5" x 7 5/8" Perma-Pak Packer with short jt 4 ½" 13.5#

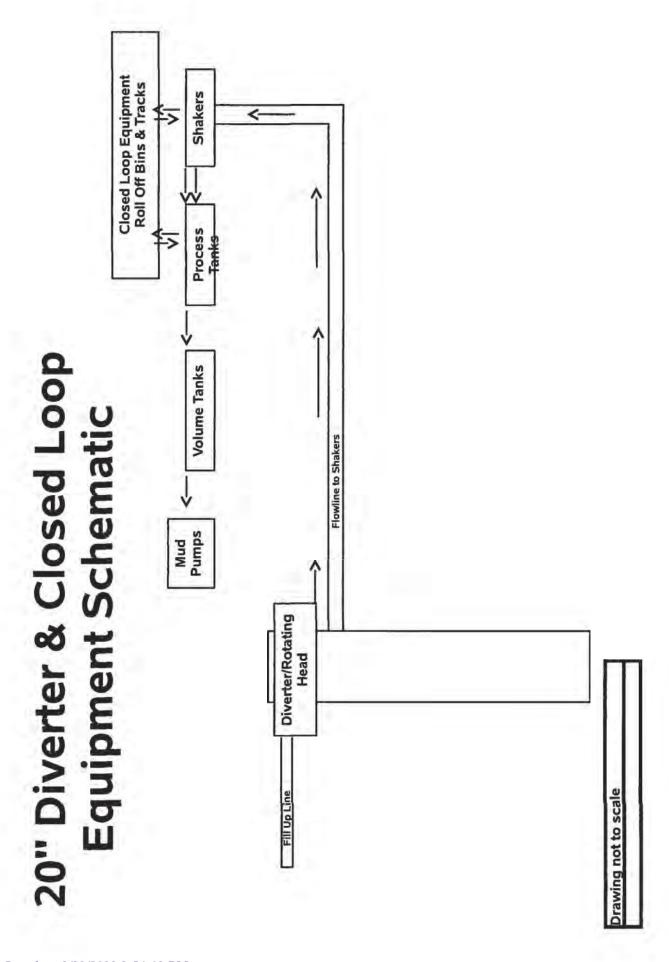

casing tail pipe & pump out plug. RIH on wireline to packer setting depth (< 100'

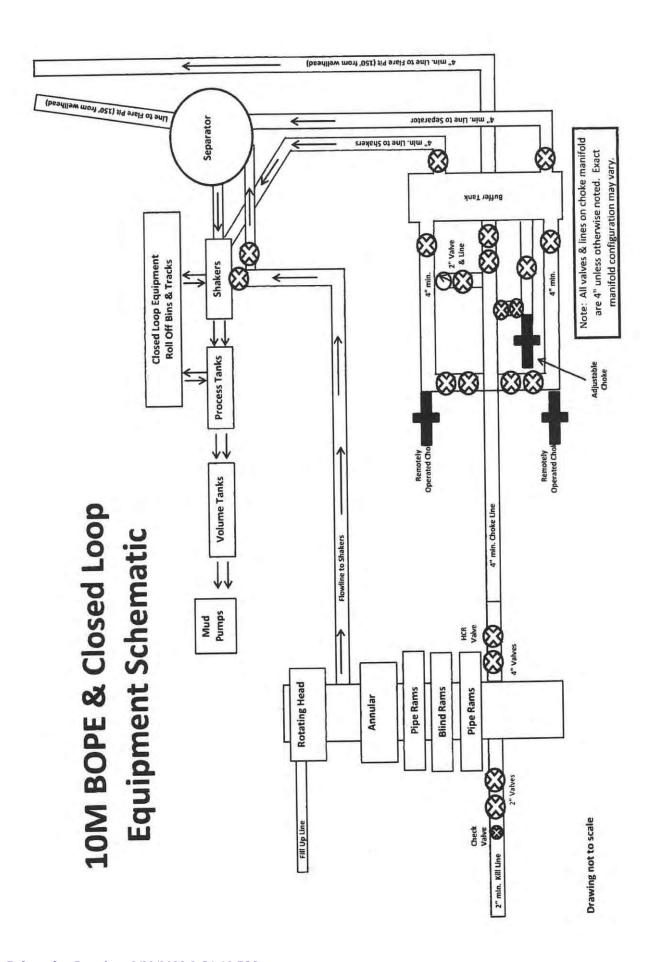

to 7 5/8" csg shoe req'd) & set packer. POH & RDMO wireline truck.

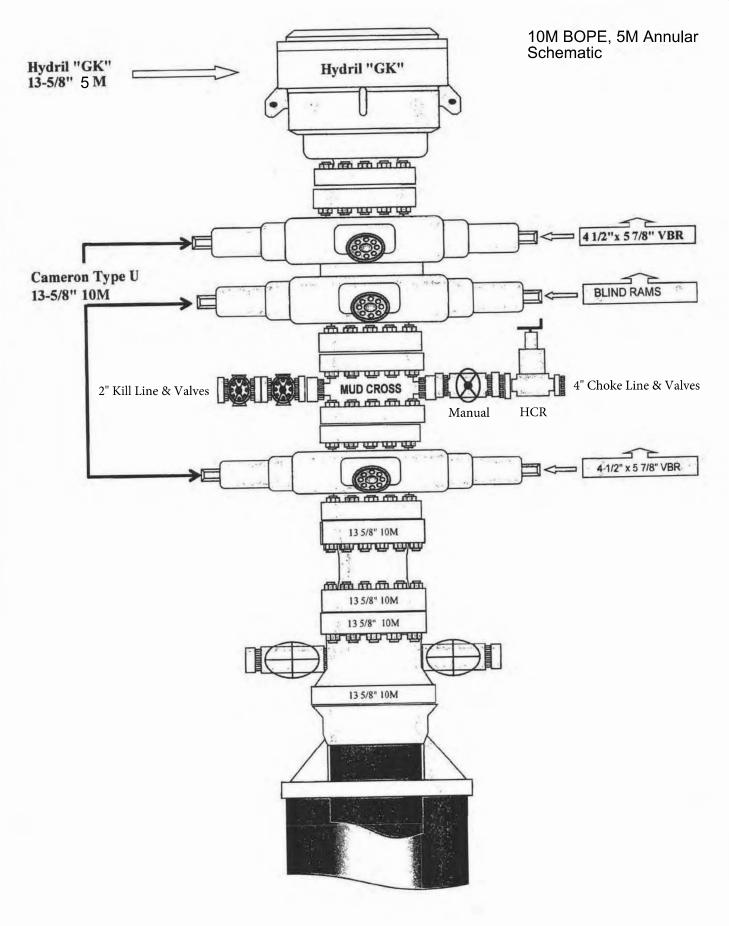

Tubing: 7" x 5 ½" Fiberglass lined tubing string

If drilled depths correspond to formation tops, RU casers. Strap, tally & clean 7" $x \, 5 \, \%$ " tubing. RIH with 7" $x \, 5 \, \%$ " tubing and Packer Top Sub. PU landing joint and space out packer to correspond with proper landing depth. Lightly tag packer to confirm space out. Reverse circulate packer fluid down backside & up tubing. Pump 25% excess. Once backside is displaced, Sting into packer & set 50-100klbs on packer. ND BOP & set well head slips with remaining string weight.

LD BOP & NU injection head. RDMO drilling rig.

Well Control Procedures

Below are the minimal high-level tasks prescribed to assure a proper shut-in while drilling, tripping, running casing, while pipe is not in the hole and moving the BHA through the BOP's. At least one well control drill will be performed weekly per crew to demonstrate compliance with the procedure and well control plan. The well control drill will be recorded in the daily drilling log. The type of drill will be determined by the ongoing operations, but reasonable attempts will be made to vary the type of drill conducted (pit, trip, open hole, choke, etc.). This well control plan will be available for review by rig personnel in the drilling supervisor's office on location and on the rig floor. All BOP equipment will be tested as per BLM Onshore Oil & Gas Order No. 2 with the exception of the **5M annular which will be tested to 100% of its RWP.** *Note: HCR valve and choke manifold will remain closed during all normal operations. Manipulation of such equipment will occur as part of the general well control proceedures.

General Well Control Procedure While Drilling

- 1. Sound alarm (alert crew)
- 2. Space out drill string
- 3. Shut down pumps (stop pumps and rotary)
- 4. Shut-in well (uppermost applicable BOP, typically annular preventer, first. HCR & choke will already be in the closed position.)
- 5. Confirm shut-in
- 6. Notify toolpusher/company representative
- 7. Read and record the following:
 - a. SIDPP&SICP
 - b. Pit gain
 - c. Time
- 8. Regroup and identify forward plan
- 9. If pressure has built or is anticipated during the kill to reach 70% or greater of the RWP of the annular preventer, confirm spacing and close the upper variable bore rams.

General Procedure While Tripping

- 1. Sound alarm (alert crew)
- 2. Stab full-opening safety valve & close
- 3. Space out drill string
- 4. Shut-in well (uppermost applicable BOP, typically annular preventer, first. HCR & choke will already be in the closed position.)
- 5. Confirm shut-in
- 6. Notify toolpusher/company representative
- 7. Read and record the following:

- a. SIDPP&SICP
- b. Pit gain
- c. Time
- 8. Regroup and identify forward plan
- 9. If pressure has built or is anticipated during the kill to reach 70% of the RWP of the annular preventer, confirm spacing and close the upper variable bore rams.

General Procedure While Running Production Casing

- 1. Sound alarm (alert crew)
- 2. Stab crossover and full-opening safety valve and close
- 3. Space out string
- 4. Shut-in well (uppermost applicable BOP, typically annular preventer, first. HCR & choke will already be in the closed position.)
- 5. Confirm shut-in
- 6. Notify toolpusher/company representative
- 7. Read and record the following:
 - a. SIDPP&SICP
 - b. Pit gain
 - c. Time
- 8. Regroup and identify forward plan
- 9. If pressure has built or is anticipated during the kill to reach 70% or greater of the RWP of the annular preventer, confirm spacing and close the upper variable bore rams.

General Procedure With No Pipe In Hole (Open Hole)

- 1. Sound alarm (alert crew)
- 2. Shut-in with blind rams (HCR & choke will already be in the closed position)
- 3. Confirm shut-in
- 4. Notify toolpusher/company representative
- 5. Read and record the following:
 - a. SICP
 - b. Pit gain
 - c. Time
- 6. Regroup and identify forward plan

General Procedures While Pulling BHA Through Stack

- 1. PRIOR to pulling last joint of drillpipe through stack:
 - a. Perform flow check. If flowing, continue to (b).

- b. Sound alarm (alert crew)
- c. Stab full-opening safety valve and close
- d. Space out drill string with tool joint just beneath the upper variable bore rams
- e. Shut-in using upper variable bore rams (HCR & choke will already be in the closed position)
- f. Confirm shut-in
- g. Notify toolpusher/company representative
- h. Read and record the following:
 - i. SIDPP & SICP
 - ii. Pit gain
 - iii. Time
- i. Regroup and identify forward plan
- 2. With BHA in the stack and compatible ram preventer and pipe combination immediately available:
 - a. Sound alarm (alert crew)
 - b. Stab crossover and full-opening safety valve and close
 - c. Space out drill string with upset just beneath the upper variable bore rams
 - d. Shut-in using upper variable bore rams (HCR & choke will already be in the closed position)
 - e. Confirm shut-in
 - f. Notify toolpusher/company representative
 - g. Read and record the following:
 - i. SIDPP & SICP
 - ii. Pit gain
 - iii. Time
 - h. Regroup and identify forward plan
- 3. With BHA in the stack and NO compatible ram preventer and pipe combination immediately available:
 - a. Sound alarm (alert crew)
 - b. If possible, pull string clear of the stack and follow "Open Hole" procedure.
 - c. If impossible to pull string clear of the stack:
 - d. Stab crossover, make up one joint/stand of drillpipe and full-opening safety valve and close
 - e. Space out drill string with tooljoint just beneath the upper variable bore ram
 - f. Shut-in using upper variable bore ram (HCR & choke will already be in the closed position)
 - g. Confirm shut-in
 - h. Notify toolpusher/company representative
 - i. Read and record the following:
 - i. SIDPP & SICP

ii. Pit gain

iii. Time

j. Regroup and identify forward plan

Hydrogen Sulfide Drilling Operations Plan

Ramrod Fee SWD #1 Eddy County, NM

1. General Requirements

No high concentrations of H2S are expected during drilling of this well. Working H2S safety equipment will be installed on location before the Delaware formation for purposes of safety and insurance requirements.

2. Hydrogen Sulfide Training

All personnel, whether regularly assigned, contracted, or employed on an unscheduled basis, will have received training from a qualified instructor in the following areas prior to entering the drilling pad area of the well:

- 1. The hazards and characteristics of hydrogen sulfide gas.
- 2. The proper use of personal protective equipment and life support systems.
- 3. The proper use of hydrogen sulfide detectors, alarms, warning systems, briefing areas, evacuation procedures.
- 4. The proper techniques for first aid and rescue operations. Additionally, supervisory personnel will be trained in the following areas:
 - The effects of hydrogen sulfide on metal components. If high tensile tubular systems are utilized, supervisory personnel will be trained in their special maintenance requirements.
 - Corrective action and shut in procedures, blowout prevention, and well control procedures while drilling a well.
 - The contents of the Hydrogen Sulfide Drilling Operations Plan.

There will be an initial training session prior to encountering a known hydrogen sulfide source. The initial training session shall include a review of the site-specific Hydrogen Sulfide Drilling Operations Plan.

3. Hydrogen Sulfide Safety Equipment and Systems

All hydrogen sulfide safety equipment and systems will be installed, tested, and operational prior to drilling below the 13 3/8" intermediate #1 casing.

1. Well Control Equipment

- Choke manifold with minimum of one adjustable choke.
- Blowout preventers equipped with blind rams and pipe rams to accommodate all pipe sizes with properly sized closing unit

Auxiliary equipment including annular type blowout preventer.

2. Protective Equipment for Essential Personnel

- A Thirty-minute self-contained work unit located in the dog house and at briefing areas.
- If H2S is encountered in concentrations less than 10 ppm, fans will be placed in work areas to prevent the accumulation of hazardous amounts of poisonous gas.
- If higher concentrations of H2S are detected the well will be shut in and POP will follow Onshore Order 6 and install a rotating head, mud/gas separator, remote choke and flare line with igniter.

3. Hydrogen Sulfide Protection and Monitoring Equipment

 Two portable hydrogen sulfide monitors positioned on location for optimum coverage and detection. The units shall have audible sirens to notify personnel when hydrogen sulfide levels exceed 20 PPM.

4. Visual Warning Systems

- Wind direction indicators as indicated on the wellsite diagram.
- Caution signs shall be posted on roads providing access to location. Signs shall be painted a high
 visibility color with lettering of sufficient size to be readable at reasonable distances from
 potentially contaminated areas.

4. Mud Program

The mud program has been designed to minimize the amount of hydrogen sulfide entrained in the mud system. Proper mud weight, safe drilling practices, and the use of hydrogen sulfide scavengers will minimize hazards while drilling the well.

5. Metallurgy

All tubular systems, wellheads, blowout preventers, drilling spools, kill lines, choke manifolds, and valves shall be suitable for service in a hydrogen sulfide environment when chemically treated.

6. Communications

State & County Officials phone numbers are posted on rig floor and supervisor's trailer. Communications in company vehicles and tool pushers are either two-way radios or cellular phones.

7. Well Testing

Drill stem testing is not an anticipated requirement for evaluation of this well. If a drill stem test is required, it will be conducted with a minimum number of personnel in the immediate vicinity. The test will be conducted during daylight hours only.

8. Emergency Phone Numbers

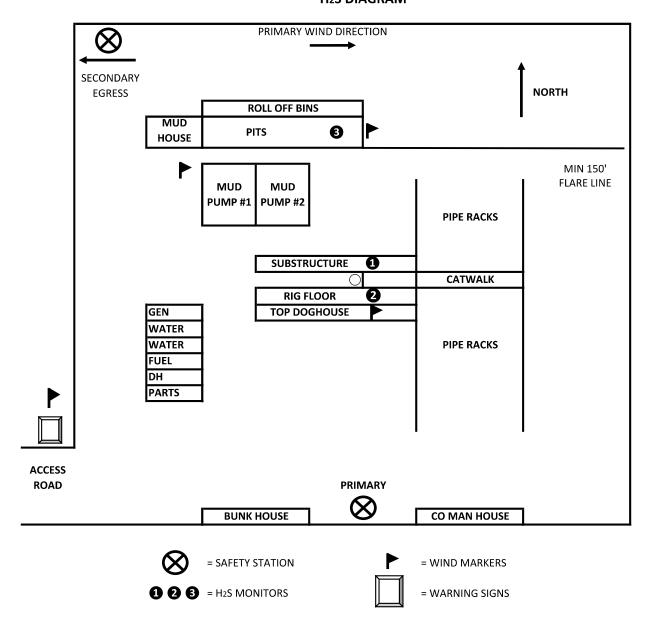

Eddy County Sheriff's Office 911 or (575) 887-7551

Ambulance Service 911 or (575) 885-2111

Carlsbad Fire Dept 911 or (575) 885-2111

Closest Medical Facility - Columbia Medical Center of Carlsbad (575) 492-5000

CONDITIONS

Created By	Condition	Condition Date
kpickford	Notify OCD 24 hours prior to casing & cement	10/22/2021
kpickford	Once the well is spud, to prevent ground water contamination through whole or partial conduits from the surface, the operator shall drill without interruption through the fresh water zone or zones and shall immediately set in cement the water protection string	10/22/2021
kpickford	Cement is required to circulate on both surface and intermediate1 strings of casing	10/22/2021
kpickford	Oil base muds are not to be used until fresh water zones are cased and cemented providing isolation from the oil or diesel. This includes synthetic oils. Oil based mud, drilling fluids and solids must be contained in a steel closed loop system	10/22/2021
kpickford	The Operator is to notify NMOCD by sundry (Form C-103) within ten (10) days of the well being spud	10/22/2021
