Good afternoon NMOCD,

Please see our attached additional information related to the Ross Gulch monitoring well. Please forgive the time elapsed since these questions were initially posed.

If there are additional questions regarding this information, could we have a meeting to resolve?

Thanks!  
Jordan

**Subject:** Ross Gulch 8 #3 SWD BHP Gauge Installation

Hey Jordan,

Attached is an updated procedure for the Ross Gulch gauge installation and illustrations to help clarify the process for installing the gauge and I'll also try to specifically address NMOCD's questions below in red. Please let us know if you see anything we may have missed or if we may need more detail on any of this.

#### Summarized Questions from NMOCD

- Provide stack-up drawings to illustrate pressure control for deployment/retrieval of gauge. **See attached illustrations showing tree configuration before, during and after gauge installation.**
  - Location of pack-off relative to BOP? **I think this is a key clarification that addresses most of the questions/concerns – the dual pack-off being installed also acts as the “BOP” during installation. If necessary while running gauge/cable into the well, the pack-off fluid in the pack-off assembly will be pressurized in order to**

seal against the cable. The pack-off assembly acts similarly to an annular BOP – when hydraulic pressure is applied it seals off around the cable in order to maintain well control (see attached pack-off drawing). The injector-head feeds/forces the cable down through the pack-off assembly during installation and is capable of doing so with pressure on the well (same applies for pulling the gauge).

- Estimated weight of equipment above pack-off that will be transferred to the pack-off? The injector-head that feeds cable through the pack-off is hoisted by crane above the pack-off, so there is very little weight transferred to the pack-off assembly.
- Prior to installing the BOP (pack-off), will the gauge & cable already be deployed below the crown valve? Yes (see steps 2 & 3 in procedure) – the well will be killed by pumping kill fluid, the lower master valve will be closed (isolating the entire tree), then the top cap above the crown valve will be removed. Cable is fed through the pack-off assembly and then the gauge is made-up to the cable, then the gauge is lowered into the tree and the pack-off assembly is installed above the crown valve (lower master valve is still closed). Then the lower master valve is opened and gauge can be ran into the well.
  - Confirm which valves will be open/closed during rigup, pressure testing, and installation. Explained above.
- How is depth control achieved to ensure the gauge is placed at correct depth? Gauge depth is determined from feet of cable unspooled from reel (wireline unit equipment tracking feet deployed from reel), correlated to desired setting depth from KB and/or ground level.
- Is there more than one pack-off installed? No, it is one dual pack-off assembly being installed.
- How is the packer (assuming this is referring to the pack-off) installed when the BOP and lubricator are already rigged up on the well? Clarified this in updated procedure and above explanations.
- No mention of rigging down BOP, please confirm when BOP will be removed. The dual pack-off assembly installed (which also acts as BOP) remains on the well.
- How is pressure seal of pack-off confirmed? Pack-off assembly can be initially pressure tested after it is installed with the gauge hanging inside the tree (with lower master valve closed). However, after installation is complete with the gauge set at depth there is no way to pressure test the pack-off other than visual leak inspection with positive pressure on the tubing. Nonetheless, the pack-off fluid is left pressurized to maintain the pack-off seal around the cable and will be monitored.
  - How will pressure seal of pack-off be monitored? The pack-off fluid pressure will be monitored, significant leak-off of the pack-off fluid pressure could be an indication of losing pressure seal competency. Visual inspection would also identify loss of seal if fluids leak by. This is just a personal observation but I think it is worth noting that the pressure seal created by the pack-off around the cable in this scenario is somewhat similar to (but certainly greater than) the seal created by a stuffing box around a polished rod on rod-pump wells.

Additional Items Requested from NMOCD

- How will cable and gauge be recovered assuming positive pressure on the well?
  - To pull the gauge:
    - Cable would be disconnected from monitoring equipment and fed up through injection-head, then spliced back onto cable from the reel.
    - Kill fluid would then be pumped down tbg/csg to control/kill the well.
    - Injector-head would then be hoisted by wireline/cable unit and set down above pack-off.
    - Pack-off fluid pressure would then be bled off (but not completely so that some degree of positive seal is still maintained), the slips in the top of the pack-off assembly would then be unset in order to begin pulling cable and gauge out of the well. My understanding is that, if necessary, the cable could actually be pulled up through the pack-off with the pack-off fluid fully pressurized.
    - Once the gauge is pulled to surface and tags up inside the tree (double verified by feet of cable spooled back onto reel), the lower master valve can then be closed in order to fully isolate the tree.
    - ND pack-off and remove injector-head, pack-off and gauge, then the top cap above the crown valve would be re-installed to secure the well.
- Details of the wellhead configuration with gauge installed. See attached illustrations/diagrams.
- Details on what the OCD Inspector need to check during site-visits.
  - Visual inspection of the pack-off to look for fluid leaking up around the cable.
  - Digital gauge on the pack-off assembly showing the pack-off fluid pressure (we'll need to update NMOCD as to what the pressure is left set at). Leak-off of greater than 10% may require the pack-off to be re-pressurized and/or further inspection.
  - The surface monitoring equipment of the BHP gauge may or may not have a surface readout, more than likely it will be a digital gauge that sends data back to our SCADA system.

I think that covers everything NMOCD was asking but please let me know if we need to address anything else for this or if we need to jump on a call with NMOCD to talk through it.

Thanks,

Brice Letcher

**Real Time Gauge Run**

---

**API #: 30-015-39736****Location: Eddy County, NM****Lat/Long: 32.0568161, -103.8011627****H2S: ND****Perforations: 4,062 – 5,517' (3 stages)****Injection Formation: Bell Canyon****Injection Zone: 4000 – 6400, packer must be set no higher than 100' above injection zone.****Maximum Wellhead Injection Pressure: 800 psi**

**Executive Summary:** Running real-time pressure & temperature gauge to sit above the wireline reentry guide for continuous monitoring.

**Procedure***(Top Perf: 4,062' Bottom Perf: 5,517' – Casing: 7" 26# HC L80 8RD)*

Contact Jose Sandoval to get gauge and running unit on location

Tally Production Systems – 432-888-0075

1. MIRU Modified Wireline Unit. Prep to run real-time bottom hole pressure gauge (RT BHPG) and cable.
2. Hoist/pick up injector-head and 5k dual pack off assembly, run cable through injector-head and dual pack off then make up gauge assembly below the pack-off to prep for install.
3. Kill the well then close bottom master valve. Function test all WH valves and pressure test tree. Remove top cap above crown valve, lower gauge through crown valve then NU dual pack off and injector-head.
4. Open bottom master valve and TIH with 0.75" OD BHPG and 0.25" OD cabling, set gauge at 4,020'.
5. Engage slips over cable in top of pack off and secure cable. Pressure up pack off to 5,000 psi and ensure no leak off to indicate good seal around cable. ND injector-head and cut cable, leaving 50'+ for connecting to monitoring equipment.
6. Remove wheels from lower and upper master valves and place near wellhead. Wheels are removed to avoid accidental cutting of the wire hanging in the well.
7. RDMO wireline unit.
8. RU monitoring equipment for BHPG and install PT gauge to monitor dual pack off fluid pressure. Ensure BHPG psi, tbg psi, csg psi, and dual pack off fluid psi gauges are reading and coming into SCADA system correctly.
9. Turn over well to SWD Foreman – Adrian Flores. All injection capabilities are to be removed from the well site.
  - a. Disconnect injection line from wellhead - LOTO
  - b. Remove power to pumps - LOTO
  - c. Remove inlet valve to facility - LOTO

Good Day Jordan

We have some questions regarding the proposed running procedure for the gauge and the dual packoff assembly. To avoid any confusion, I wish to clarify the following terminology

- **Swab/Crown Valve: (CV)** Uppermost valve in the image below
- **Flow Cross:** 4-way Block below the crown valve with side outlets for wing & kill valves
- **Upper Master Valve: (UMV)** Manual valve below the flow cross
- **Lower Master Valve: (LMV)** Manual Valve below the Upper valve (ie. lowermost valve in below image)

I have pasted a copy of your procedure below, and inserted questions / items to clarify in **red text**.

### Procedure

(Top Perf: 4,062' Bottom Perf: 5,517' – Casing: 7" 26# HC L80 8RD)

Contact Jose Sandoval to get gauge and running unit on location

Tally Production Systems – 432-888-0075

1. MIRU Modified Wireline Unit. Prep to run real-time bottom hole pressure gauge (RT BHPG) and cable.
2. NU 5K BOP and new swap valve packer. Function test all valves and pressure test connections before proceeding.
  - Please provide a stack-up drawing to illustrate the pressure control equipment utilized for deployment and retrieval of the gauge.
    - It is assumed both packoffs will be pre-installed below the BOP during deployment and/or retrieval? Please confirm
    - What is the estimated weight of the BOP's and Pressure control

- equipment that will be transferred to the packoff assemblies?
- Please confirm the packoffs are designed to handle the compressive and shear loads transmitted via the BOP and Pressure control equipment during rigup, pressure testing, deployment and retrieval.
  - Prior to installing the BOP, will the gauge and cable already be deployed below the crown valve?
    - Note: The gauge is ~ 14" long and OD=0.75". Since the Packoff ID= 0.25", the only option appears to deploy the gauge below the crown valve ( ie. hung across the flow cross and UMV) while rigging up the BOP? Please confirm
    - Barrier protocol - Please confirm which valves will be open / closed during rigup and pressure testing of the BOP and lubricator
  - 3. TIH 0.75" OD BHPG and 0.25" OD cabling. Stop at 4,020'.
    - How is depth control achieved to ensure the gauge is placed at 4020 ft?
  - 4. Secure cabling. NU double swap packer. ND Lubricator, RD Wireline Unit.
    - Is this different from the swab valve packer that was installed in Step 2?
    - How is the packer installed when the BOP and lubricator are already rigged up on the well?
    - No mention of rigging down BOP. Please confirm when BOP will be removed. Presumably after pressure seal is confirmed in Step 5?
  - 5. Check for leaks and increase packing fluid as needed to confirm pressure seal.
    - How is pressure seal confirmed? Via inflow test? How do you confirm if there is no pressure on the wellhead at the time?
    - Are there any other pressure tests planned to confirm the packoff seal integrity?
  - 6. Remove wheels from lower and upper master valves and place near wellhead. Wheels are removed to avoid accidental cutting of the wire hanging in the well.
  - 7. RDMO
  - 8. Turn over well to SWD Foreman – Adrian Flores. All injection capabilities are to be removed from the well site.
    - a. Disconnect injection line from wellhead - LOTO
    - b. Remove power to pumps - LOTO
    - c. Remove inlet valve to facility - LOTO

Additional items:

1. Please provide a procedure detailing how the cable and gauge will be recovered assuming positive pressure on the well
2. For the benefit of OCD inspectors who will visit the site, please provide the following:
  - a. Details of what the entire stack-up assembly will look like once the gauge has been deployed.
  - b. Details on what the OCD Inspectors need to check during visits to the well
    - i. Packoff pressure ?
    - ii. Level / quantity of Packing fluid in the reservoir?
    - iii. Packing fluid pump ?
    - iv. Surface readout panel?
    - v. Other items?

Thanks and Regards

Regards  
 Tony Harris  
 Petroleum Specialist

### Application

DataCan's Multi-Gauge Piezo Bottom Pressure Tool can be used on its own or at the bottom of a multi-gauge pressure system. This tool comes in a standard version as well as a pressure testable version for quality assurance.

### Benefits

The Multi-Gauge Piezo Bottom Pressure Tool is easy to install and produces high quality reservoir data in real time. It's fully welded construction, dual protection metal to metal seal design, and hermetically sealed electronics make it a very reliable product. This is the final gauge in a multi-gauge system. Alternatively, this gauge can be used on its own as a single gauge in a single gauge system.

The Crimp-y-doo, at the heart of DataCan's new gauge design, ensures correct wire prep and prevents the TEC conductor from pulling up into the armor. If you find yourself assembling a gauge without a crimp-y-doo, you just better crimp-y-don't!

### Features

- o Fully Welded Construction
- o Hermetically Sealed
- o Corrosion Resistant - NACE MR0175
- o Slim 0.75" Diameter
- o Pressure Testable Option

### Multi-Gauge Piezo Bottom Pressure Tool - Standard
