Received by OCD: 8/11/2024 11:47:47 AM

EXECUTIVE SUMMARY

This report summarizes the successful mechanical integrity testing (MIT) and falloff testing activities performed on the Gaines WDW-3 (WDW-3) at the HollyFrontier Navajo Refining Company (HFNR) facility at Artesia, New Mexico. The work was performed as a condition of the applicable UIC permit issued by the New Mexico Oil Conservation Division (OCD). Under contract, Petrotek Corporation (Petrotek) developed the test procedures, provided field supervision, completed pressure transient test analysis, and prepared the final report documenting the fieldwork on the Class I non-hazardous injection well.

The test procedures were submitted to the OCD headquarters and OCD District II on June 11, 2024, before field activities commenced. Attachment 1 presents the test notification and procedures submitted to OCD. Approvals were received from regulatory agency staff prior to commencement of activities. Barbara Lydick of OCD was present to witness MIT testing. MIT and reservoir testing activities were supervised by Adam Simonsen (Petrotek) from July 9 through July 11, 2024.

The field activities consisted of an annulus pressure test (APT) and a pressure transient injection falloff test on WDW-3. The well satisfactorily demonstrated mechanical integrity pursuant to the applicable UIC permit, guidelines and regulations. All testing requirements were satisfied as a result of the work performed. Wellbore and reservoir properties were confirmed as similar to those determined from analysis of the previous testing conducted in the well.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

1. FACILITY INFORMATION

a. **Name** - HollyFrontier Navajo Refining Company
b. **Location** - Highway 82 East, Artesia, New Mexico, 88211
c. **Operator's OIL AND Gas Remittance Identifier (GRD) Number** - 15694

2. WELL INFORMATION

a. **OCD UIC Permit number authorizing injection** - OCD UIC Permit: UICI-008-3
b. **Well classification** - Class I Non-hazardous
c. **Well name and number** - Gaines WDW-3
d. **API Number** - 30-015-26575
e. **Legal Location** - Section 1, Township 18S, Range 27E, 2250 FWL, 790 FSL

3. CURRENT WELLBORE SCHEMATIC

A wellbore schematic displaying the well configuration during testing is provided as Figure 1. A wellhead schematic is provided as Figure 2.

4. COPY OF AN ELECTRIC LOG ENCOMPASSING THE COMPLETED INTERVAL

A copy of the dual induction log run in 1991 during the initial completion of the well was submitted with the original permit and can be found online on the OCD website as part of the OCD well files for this well:

https://ocdimage.emnrd.nm.gov/imaging/WellFileView.aspx?RefType=WL&RefID=30015265750000

5. COPY OF RELEVANT PORTIONS OF ANY POROSITY LOG USED TO ESTIMATE FORMATION POROSITY

A copy of the neutron density log, encompassing the completed interval between 7,660 and 8,620 ft KB, can be found online on the OCD website as part of the well files for this well. From these logs, it was determined that the injection reservoir thickness was approximately 175 feet with an average porosity of 10 percent. Consistent with the most recent test analysis submitted, these values were used for the analysis performed in this report.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

6. PVT DATA OF THE FORMATION AND INJECTION FLUID

As reported in previous test analysis reports, fluid samples of connate brine from the injection interval were collected from the WDW-1 (33,000 mg/L) and WDW-2 (20,000 mg/L) during recompletion as Class I UIC wells. Both of these wells are completed in the same injection formation as WDW-3. The average density and total dissolved solids (TDS) of the fluids recovered from the two wells were 1.03 g/cc and 26,500 mg/l, respectively. The results of formation fluid analysis were provided in documents previously submitted to and approved by OCD. Available analyte values for WDWs 1, 2 and 3 are provided in Table 1. Note that formation fluid samples were collected from WDW-4, but the well was completed in a separate injection zone. As such, WDW-4 geology and formation fluid samples will be discussed separately in the testing report for that well.

TABLE 1
HFNR FORMATION FLUID SAMPLE ANALYSIS RESULTS

Chemical	Mewbourne Well (WDW-1)	Chukka Well (WDW-2)	Gaines Well (WDW-3)	Average
Date	7/31/1998	6/14/1999	9/8/2006	
Fluoride (mg/L)	2.6	9.7	ND	6.15
Chloride (mg/L)	19,000	15,000	10,447	14,816
NO_3-N (mg/L)	<10	<10	--	<10
SO_4 (mg/L)	2,200	2,000	1,908	2,036
$CaCO_3$ (mg/L)	1,000	1,210	--	1,105
Specific Gravity (unitless)	1.0340	1.0249	--	1.0295
TDS (mg/L)	33,000	20,000	--	26,500
Specific Conductance (uMHOs/cm)	52,000	43,000	--	47,500
Potassium (mg/L)	213.0	235.0	85.5	177.8

Calcium (mg/L)	390	609	393	464
Sodium (mg/L)	12,770	8,074	6,080	8,975
pH	8.10	7.20	--	7.65

Note: ND: Non-detect; -- indicates no analysis.

The formation viscosity, fluid compressibility, and total compressibility were estimated using the average brine salinity along with the recorded bottom hole pressure and temperature in conjunction with industry standard correlations. The correlations used are from the SPE textbook on Pressure Transient Testing which was published as part of the SPE Textbook Series as Volume 9. For the sake of brevity, only page, equation, and figure numbers from this volume are listed subsequently in this report as a reference for all correlations presented for the PVT data.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

The percent solids for the fluid was approximated as 2.65%, based on the average 26,500 mg/l TDS brine concentration for the formation samples in Table 1. A bottom hole temperature of 127.4 °F has been used as representative of the formation for these correlations. This value was derived from the original temperature log, run in 2006 when the well was recompleted. This log is can be found online on the OCD site as part of the well files for this well.

Fluid viscosity was estimated using multiple equations developed by McCain that first are used to estimate fluid viscosity at atmospheric conditions (equations B-72, 73, and 74), which is then converted to viscosity at bottom hole conditions (equation B-75) by using a correction factor. These equations can be found on page 527. As a primary input for the correlation, pressure is required. The original formation pressure has been estimated at a depth of 7,660 feet BGL using the average formation fluid specific gravity based on the TDS values provided in Table 1. Using this method, a value of 3,404.7 psi has been estimated as the original pressure at gauge depth (7,660 feet BGL). At this pressure and a temperature of 127.4 °F, the following equations have been used to derive viscosity:

$$\mu_{w1} = AT^{B} \quad \text{(B-72)}$$

$$A = 109.574 - 8.40564 * S + 0.313314 * S^2 + 8.72213 * 10^{-3} * S^3 \quad \text{(B-73)}$$

$$B = -1.12166 + 2.63951 * 10^{-2} * S - 6.79461 * 10^{-4} * S^2 - 5.47119 * 10^{-5} * S^3 + 1.55586 * 10^{-6} * S^4 \quad \text{(B-74)}$$

$$\frac{\mu_w}{\mu_{w1}} = 0.9994 + 4.0295 * 10^{-5} * P + 3.1062 * 10^{-9} * P^2 \quad \text{(B-75)}$$

Where,

μ_{w1} is the viscosity of the formation fluid at atmospheric conditions
T_F is the bottom hole temperature in °F
S is the percent of solids
P is the bottom hole pressure in psi
μ_w is the viscosity of the brine at bottom hole conditions

Using these equations, a value of 0.56 centipoise is calculated for the formation fluid viscosity.

Formation Compressibility was estimated using equation L-89 provided on page 337. This equation was developed for limestone formations, consistent with the primary composition of the effective injection interval (see discussion in Section 11).

$$cf = \frac{a}{(1+bc\Phi)^{\frac{1}{b}}} \quad \text{(L-89)}$$

Released to Imaging: 5/19/2025 1:24:19 PM

Where,

a = 0.8535
b = 1.075
c = 2.303 E06
Φ = 0.10

Based on this equation, a value of 8.20E-6 psi^{-1} is derived for formation compressibility.

Fluid compressibility was estimated using figures L-30 and L-31 on page 338. The estimate is based on a bottom hole temperature of 127.4 °F, a bottom hole pressure of 3,404.7 psi, and a solids weight of 2.65%. Using Figure L-31 to first estimate freshwater compressibility, a value of 2.86E-06 psi^{-1} is derived. Using Figure L-30, the coefficient of isothermal compressibility (ratio of brine compressibility over freshwater compressibility) was determined to be approximately 0.95. This results in a value of 2.70E-06 psi^{-1} for the formation fluid compressibility (c_w).

By combining the formation and formation fluid compressibility, the total system compressibility is determined. The total system compressibility (c_t) is approximately 10.9 E-06 psi^{-1}.

The values presented in this section have been utilized for analysis unless stated otherwise.

7. DAILY RATE HISTORY FOR A MINIMUM OF ONE MONTH PRECEDING THE FALLOFF TEST

The following table summarizes data acquired with HFNR well monitoring equipment. Figure 11, discussed in the following sections, also presents daily average injection rates graphically from June 1 through July 8, 2024.

TABLE 2
INJECTION DATA ONE MONTH PRIOR TO TESTING

Date	Injection Pressure (psi)	Injection Rate (gpm)	Annulus Pressure (psi)
6/1/2024	1,225.2	120.3	625.4
6/2/2024	1,225.3	121.2	641.3
6/3/2024	1,231.0	122.0	670.5

7/4/2024	1,225.2	122.5	760.9
7/5/2024	1,220.9	120.4	739.4
7/6/2024	1,230.2	124.5	636.6
7/7/2024	1,253.6	128.3	621.1
7/8/2024	1,275.2	130.1	658.7

8. CUMULATIVE INJECTION INTO THE FORMATION FROM TEST WELL

At the time of shut-in for testing this year, the cumulative volume of waste injected into this well since operations began was 26,631,267 barrels (1,118,513,199 gallons).

Received by OCD: 8/11/2024 11:47:47 AM

9. PRESSURE GAUGES

a. **Describe the type of downhole surface pressure readout gauge used included manufacturer and type -** Two downhole pressure and temperature memory gauges were utilized for the falloff testing. The gauges were 1.25-inch Quartz pressure and temperature memory gauges manufactured by DataCan (Part No. 101699).

b. **List the full range, accuracy and resolution of the gauge(s) -** The memory gauges are designed to measure pressure to an accuracy of 0.03% of full scale and a resolution of 0.01% of full scale, and operate within a range of 14.7 to 16,000 psi.

c. **Provide the manufacturer's recommended frequency of calibration and a calibration certificate showing the date the gauge was last calibrated -** These gauges are recommended to be calibrated once per year. These gauges were last calibrated on 5/27/2024. The most recent calibration certificates are provided in Attachment 4. The bottom gauge (Serial Number - 224831) was utilized for analysis and hung at a test depth 7,572 feet KB (7,557' BGL).

10. ONE-MILE AREA OF REVIEW (AOR)

A standard one-mile Area of Review (AOR) was evaluated for WDW-3 by Petrotek as part of the annual testing and reporting requirements. The wells located within this one-mile AOR are listed in Attachment 6. This table contains the operator, well name, API number, well type, well status, location, and dates of spud and abandonment. A figure displaying the wells located in the AOR and the wells in the surrounding sections has been provided as Figure 13.

No new wells have been drilled or P&A'd within the AOR since the prior report.

a. **Wells located within the one-mile AOR -** The wells located within the one-mile AOR are provided as Attachment 6. This table contains the operator, well name, API number, well type, well status, location, and date of abandonment or completion.

b. **Status of wells within AOR -** In Attachment 6, SWD indicates Salt Water Disposal, P&A indicates Plugged and Abandoned, TA indicates Temporarily Abandoned, and AL indicates Abandoned Location.

c. **Provide details on any offset producers and injectors completed in the same injection interval -** HFNR operates three other Class I Injection wells, two of which are completed in the same interval, WDW-1 and WDW-2. Only WDW-2 is located within the AOR. Based on public data, there are three additional wells, not operated by HFNR that are located within the AOR and inject into the same interval. No offset producers exist in the injection interval within the AOR based on public data. Additional information is presented in Section 12 of this report.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

11. GEOLOGY

a. Describe the geologic environment of the injection interval
b. Discuss the presence of geologic features, i.e., pinchouts, channels and faults, if applicable
c. Provide a portion of a relevant structure map, if necessary

The following discussion provides detailed responses to the requirements listed above. This discussion is primarily based on information presented in previous permit applications for this well.

The WDW-1, 2 and 3 wells are located in the northern part of the Delaware Basin. The injection interval for the three wells are composed of carbonates from the Permian-age Lower Wolfcamp Formation, Pennsylvanian-age Cisco Formation, and Pennsylvanian-age Canyon Formation. The Wolfcamp unconformably overlies the Cisco and Canyon Formations. Table 3, sourced from the 2019 MIT report, presents a summary of the logged formation depths for these formations in each of the wells. The geologic interpretations have been confirmed but not revised as part of this report.

TABLE 3
HFNR INJECTION FORMATION TOPS – WDW-1, 2 and 3

Formation	WDW-1 (KB = 3,693 ft AMSL)		WDW-2 (KB = 3,623 ft AMSL)		WDW-3 (KB = 3,625 ft AMSL)	
	MD, KB (ft)	AMSL, KB (ft)	MD, KB (ft)	AMSL, KB (ft)	MD, KB (ft)	AMSL, KB (ft)
Lower Wolfcamp	7,450	-3,757	7,270	-3,647	7,303	-3,678
Cisco	7,816	-4,123	7,645	-4,022	7,650	-4,025
Canyon	8,475	-4,782	8,390	-4,767	8,390	-4,765
Base of Injection Zone (Base of Canyon)	9,016	-5,323	8,894	-5,271	8,894	-5,269

The lower portion of the Wolfcamp Formation, referred to as the Lower Wolfcamp, is the uppermost unit in the injection interval. The top of the zone ranges from 7,303 – 7,450 feet KB in the referenced wells. A structure map of the top of the Lower Wolfcamp is provided in Figure 3. The Wolfcamp ranges from fine to medium-grained, limestones with interbedded shales (Meyer, 1966). The picks for the top of the Wolfcamp were made from log correlations. The Wolfcamp is overlain by the dense, dolomitic Abo Formation. The gross thickness of the Lower Wolfcamp is approximately 363 feet. According to porosity log data from the area, the Wolfcamp porosity is generally greater than 5%.

The Cisco Formation is described as consisting of limestone/dolomite with some interbedded shales and fine-grained sandstones (Lindsay et. al., 2006). The top of

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

the Cisco occurs at approximately 7,645 – 7,816 feet KB. A structure map of the top of the Cisco can be found in Figure 4. Coarse-grained dolomites have been noted to have interstitial to cavernous porosity (Lindsay et. al., 2006). At the three HFNR wells, the Cisco Formation is a porous dolomite that ranges from gross thickness of 659 feet to 745 feet. The net thickness using a porosity cutoff of greater than 10% is approximately 100 feet in WDW-1, 32 feet in WDW-2, and 65 feet in WDW-3.

The Canyon Formation typically consists mostly of brown limestone with interbedded grey shales (Lindsay et. al., 2006). The top of the Canyon occurs at approximately 8,400 KB. Some white sandstone and conglomerates have been noted at the base of the Canyon (Lindsay et. al., 2006). Some dolomites have been noted to be present in the Canyon as well. Gross thickness of the Canyon Formation is approximately 504-541 feet in the three wells. The net thickness using a porosity cutoff greater than 5% is approximately 34 feet in WDW-1, 30 feet in WDW-2, and 10 feet in WDW-3. No intervals appear to have a porosity more than 10% based on log review. A structure map is provided in Figure 5 which displays the top of the Strawn Formation, indicating the bottom of the Canyon.

12. OFFSET WELLS

HFNR operates three other Class I Injection wells locally, two of which are completed in the same interval, WDW-1 and WDW-2. Only WDW- 2 is listed in Attachment 6 since WDW-1 is not within the 1-mile AOR surrounding WDW-3. No changes have occurred to either of these wells since testing last year.

WDW-1 is approximately 7,900 feet to the northeast of WDW-3, while WDW-2 is approximately 3,200 feet to the southwest of WDW-3. These wells are at a significant distance from the test well in a relatively high permeability system, and are not considered to have had an unacceptable impact on the testing performed on WDW-3.

There are three additional wells, not operated by HFNR, that are within the AOR and inject into the same formation interval. These wells are the AAO Federal SWD #1 (API #30-015-42549,) operated by Apache Corporation, and the Chalk Bluff Federal SWD #001 (API #30-015-27163) and Federal T SWD #1 (API #30-015-26404), both operated by Riley Permian, LLC.

a. **Identify the distance between the test well and any offset wells completed in the same injection interval –** WDW-2 is approximately 3,200 feet to the southwest, the Federal T SWD #1 is approximately 2,500 feet to the southeast, the Chalk Bluff Federal SWD #001 is approximately 2,300 feet to the northeast, and the AAO Federal SWD #001 is approximately 2,000 feet to the north-northeast.

b. **Report the status of the offset wells during both the injection and shut-in portions of the test -** The offset HFNR wells were operated at a constant rate

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

during WDW-3 reservoir testing. Data from the state website, last updated in May 2024 indicated average injection rates of approximately 22 gpm for the AAO Federal SWD #1, 93 gpm for the Chalk Bluff Federal SWD #001 and 157 gpm for the Federal T SWD #1 during the month that WDW-3 was tested.

c. **Describe the impact, if any, of the offset wells during both the injection and shut-in portions of the test -** These offset injectors did not prevent conducting a useful test on the well, although late-time data is likely impacted by the start of non-radial flow effects. Further discussion of possible late-time effects is included in Section 15 of this report.

13. CHRONOLOGICAL LISTING OF THE DAILY TESTING ACTIVITIES

a. **Date of the test -** Testing was performed from July 9 through July 11, 2024.

b. **Time of the injection period -** Test injection occurred for approximately 48 hours before the falloff test began. This uninterrupted injection period exceeded the duration of the falloff. Figure 8 of this report shows a zoomed-in section of the final portion of the injection period, but the data collected and used in the analysis accounts for the continuous injection that started approximately two days prior to shut-in and the substantial injection that occurred since testing last year.

c. **Type of injection fluid -** Filtered waste was utilized for injection fluid.

d. **Final injection pressure and temperature prior to shutting in the well -** Prior to shutting in the well, the bottom hole flowing injection pressure was 4,368.4 psia (at 7,557 feet BGL) and the final injection rate was 102.5 gpm (3,515.4 bpd) with a measured bottom hole temperature of 106.3 °F.

e. **Total shut-in time -** The well was shut-in for approximately 44 hours for testing.

f. **Final static pressure and temperature at the end of the falloff portion of the test -** At the conclusion of the test, the final bottom hole pressure was 4,254.7 psia and the final bottom hole temperature was 111.6 °F. Final pressure at the end of the test was approximately 114 psi lower than the injection pressure just prior to shut-in.

14. DESCRIBE THE LOCATION OF THE SHUT-IN VALVE USED TO CEASE FLOW TO THE WELL FOR THE SHUT-IN PORTION OF THE TEST

The well was shut-in using a wing valve located on the inlet side of the wellhead.

15. PRESSURE FALLOFF ANALYSIS

This section addresses requirements 15-19 of Section IX, Report Components, of the OCD's falloff test guidelines.

The equations, parameters and calculations utilized to derive results are detailed below. Table 4 shows input values used to perform the specified calculations.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

The raw digital data collected during the test is provided in Attachment 7. The contracted service company that supplied the gauges used for testing generated an injection falloff test summary report based on the data that was collected. This report is provided in Attachment 5.

a. **Radius of test investigation -** The radius of investigation for this test was determined to be 5,002 feet based on the average permeability derived from test analysis.

b. **Time to beginning of the infinite acting portion of the test -** The time at which the test began to transition into radial flow was approximately 9 hours after shut-in. This value was derived from the log-log plot.

c. **Slope(s) determined from the semi-log plot -** The slope for this likely radial period, as determined by the semi-log plot, was 4.53 psi/cycle.

d. **Transmissibility (kh/μ) -** The transmissibility was determined to be 126,118 md-ft/cp.

e. **Permeability (k) -** The permeability was determined to be 404 md.

f. **Skin Factor (s) -** The skin factor was determined to be 19.1 units.

g. **Pressure drop due to skin (ΔP_{skin}) -** The pressure drop due to skin was determined to be 75.1 psi

h. **Flow efficiency -** The flow efficiency was determined to be 0.34.

i. **Flow capacity (kh) -** The flow capacity (permeability-thickness) was determined to be 70,626 md-ft.

j. **P_{1hr} -** The extrapolated 1-hr pressure was determined to be 4,263.5 psi.

TABLE 4
FALLOFF TEST ANALYSIS INPUT VALUES

Parameter	Value	Unit
Formation Thickness, h	175	feet
Porosity, Φ	10	percent
Viscosity, μ	0.56	centipoise
Formation Compressibility, c_f	8.20E-06	1/psi
Total Compressibility, c_t	10.90E-06	1/psi
Formation Volume Factor, B	1.00	bbl/stb
Wellbore Radius, r_w	0.3246	feet
Final Well Flowing Pressure, p_{wf}	4,368.4	psia
Final Injection Rate, q_{final}	3,515.4 102.5	bwpd (gpm)
Horner Straight Line Slope, m	4.5323	psi/cycle

The average historical injection period used to account for total volume in the analysis was calculated by dividing the cumulative historical injection through 6/22/2020 (21,187,321 barrels) by the final injection rate (47.0 gpm). This resulted

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

in a value of 315,489 hours of injection at 47.0 gpm. This value was used in conjunction with the injection data collected from 6/23/2020 through 7/9/2024. The total waste volume injected up to the time of shut-in utilized for calculations was 1,118,513,199 gallons (26,631,267 bbls).

To determine the mobility-thickness (transmissibility), the following equation was utilized. The resulting transmissibility was 126,118 md-ft/cp.

$$\frac{kh}{\mu} = 162.6\frac{q_{final}B}{m}$$

Where,

k is the permeability, in md
h is the formation thickness, in feet
μ is the viscosity of the formation fluid, in cp
q is the final flow rate, in bpd
B is the formation volume factor in RB/STB
m is the slope of the line assigned to the radial flow period on the semi-log plot, in psi/cycle

and 162.6 is a unit conversion constant

$$\frac{kh}{\mu} = Transmissibility = 162.6\frac{3{,}515.4 * 1.0}{4.5323} = 126{,}118\frac{md-ft}{cp}$$

The transmissibility was then used to determine the permeability thickness. The resulting permeability-thickness was 70,626 md-ft.

$$kh = \left(\frac{kh}{\mu}\right)\mu = 126{,}118\left(\frac{md-ft}{cp}\right)0.56\ cp = 70{,}626\ md-ft$$

The permeability thickness was then used to determine the permeability of the reservoir. The resulting permeability was 404 md.

$$k = \frac{kh}{h} = \frac{70{,}626\ md-ft}{175\ ft} = 404\ md$$

In order to determine if the proper viscosity was utilized in the previous calculations, it must be determined if the pressure transient was traveling through reservoir fluids. This is done by determining the time it is expected to take the pressure transient to travel through the injected fluid. The first step of this is to determine the approximate radius of waste emplaced by injection. The piston-like displacement resulting radius was estimated to be 1,649 feet.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

$$r_{waste} = \sqrt{\frac{0.13368 * V}{\pi h \Phi}}$$

Where,

r_{waste} is the distance to the waste front, in feet
V is the total volume of fluid injected into the well, in gallons
h is the formation thickness, in feet
Φ is the porosity, as a fraction
0.13368 is a conversion constant

$$r_{waste} = \sqrt{\frac{0.13368 * (1{,}118{,}513{,}199)}{\pi * 175 * 0.10}} = 1{,}649\ feet$$

Based on this radius, the time for a pressure transient to travel through this fluid can be calculated. The resulting time was 3.90 hours.

$$t_{waste} = 948 \frac{\Phi \mu_{waste} c_t r_{waste}^2}{k}$$

Where,

t_{waste} is the time for a pressure transient to reach the waste front, in hours
Φ is the porosity, as a fraction
μ_{waste} is the viscosity of the waste, in cp
r_{waste} is the radius of the waste front, in feet
c_t is the total compressibility, in psi^{-1}
k is the permeability, in md
948 is a conversion constant

$$t_{waste} = 948 \frac{0.10 * 0.56 * 10.90E-06 * (1{,}649)^2}{403.6} = 3.90\ hours$$

Based on this result, and the time it took for radial flow to be reached in this test (~9 hours), it is known that the pressure transient was traveling through reservoir fluid during the middle-time radial flow period, indicating that the appropriate viscosity was used for analysis.

The near wellbore damage, referred to as skin, can be calculated based on the results of the straight line, semi-log analysis as well. This is done by utilizing the following equation. The result of this calculation was 19.1 units.

$$s = 1.151 \left(\frac{P_{wf} - P_{1hr}}{m} - log\left(\frac{k}{\Phi \mu c_t r_w^2} \right) + 3.23 \right)$$

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

Where,

s is skin damage, in units
P_{wf} is the shut-in well pressure, in psi
P_{1hr} is the extrapolated pressure at a time of 1 hour, using the slope of the straight line from the semi-log analysis, in psi
m is the slope of the radial line, in psi/cycle
k is the permeability, in md
Φ is the porosity, as a fraction
μ is the viscosity, in cp
r_w is radius of the wellbore in feet
1.151 and 3.23 are constants

$$s = 1.151\left(\frac{4{,}368.4 - 4{,}263.5}{4.5323} - log\left(\frac{403.6}{0.10 * 0.56 * 10.90E-06 * 0.3246^2}\right) + 3.23\right) = 19.1$$

The change in pressure, due to skin, in the wellbore can be calculated using the following equation. The result of this calculation was 75.1 psi of pressure due to skin.

$$\Delta P_{skin} = 0.869 * m * s$$

Where,

ΔP_{skin} is the change in pressure due to skin damage, in psi
m is slope of the radial line, in psi/cycle
s is skin, in units
0.869 is a conversion constant

$$\Delta P_{skin} = 0.869 * 4.5323 * 19.1 = 75.1\ psi$$

The flow efficient (FE) can be determined using the following equation, provided within the OCD Guidelines (Section IX, 15, h). The result of this calculation was 0.34.

$$FE = \frac{P_{wf} - \Delta P_{skin} - P_{end\ of\ test}}{P_{wf} - P_{end\ of\ test}}$$

Where,

P_{wf} is the shut-in well pressure, in psi
ΔP_{skin} is the change in pressure due to skin damage, in psi
$P_{end\ of\ test}$ is the pressure at the end of the falloff test, in psi

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

$$FE = \frac{4{,}368.4 - 75.1 - 4{,}254.7}{4{,}368.4 - 4{,}254.7} = 0.34$$

A portion of the pressure fall-off observed in this test is associated with near wellbore conditions, and a smaller portion of the total pressure drop observed is due to pressure transients in the reservoir. The well continues to have sufficient capacity for necessary injection, so the limited skin damage observed is not a significant factor regarding current well operations.

The test radius of investigation (r_{inv}) can be determined using the following equation. The result of this calculation was 5,002 feet.

$$r_{inv} = 0.029\sqrt{\frac{kt}{\Phi\mu c_t}}$$

Where,

k is permeability, in md
t is time, in hours
Φ is porosity, as a fraction
μ is viscosity, in cp
c_t is total compressibility, in psi^{-1}
0.029 is a constant

$$r_{inv} = 0.029\sqrt{\frac{403.6 * 44.05}{0.1 * 0.56 * 10.90E-06}} = 5{,}002\ feet$$

Based on examination of the log-log diagnostic plot included as Figure 9 and the superposition time semi-log plot provided as Figure 10, the test reached what appears to be the beginning of radial flow approximately 9 to 10 hours after shutting the well in. This middle-time radial flow dominated data likely extends until approximately 30 hours of shut-in. Early-time data exhibited extended storage effects which continue for approximately 4 hours following shut-in. The test has been analyzed using the analytical Horner semi-log method based on the reasonable assumption that a period of radial flow exists in the data. Figure 10 presents a simple analysis consistent with the pseudo straight-line analysis equations presented in the preceding text. Figure 9 presents a simulation analysis generated for a radial-composite flow system which incorporated a limited-extent, infinite-conductivity fracture system to model the extended wellbore storage period. The simulation analysis generally supports the more simplistic graphical analysis based on the radial flow indicated by the diagnostic plot that shows as the linear portion of the semi-log plot.

Toward the end of the test it is possible that a late-time period may be developing

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

where the effects of heterogeneity, multi-layer crossflow or offset injection interference may be starting to influence the test. However, the substantial permeability-thickness of this injection zone that yielded relatively small pressure changes during both middle- and late-time periods of the test generate a somewhat noisy derivative even with the high-resolution gauges used to collect the pressure-transient data so the behavior at the end of the test may be as much associated with data acquisition and processing as any possible heterogeneity factors. The character of the fall-off data and the derivative are sufficient for valid analysis and are similar to the patterns evident in previous testing of this well.

The following figures are provided:

- Figure 6 - Cartesian Plot of Pressure, Temperature and Rate vs. Time
- Figure 7 - Full Rate History Plot
- Figure 8 - Cartesian Plot of Pressure Falloff with Model Match
- Figure 9 - Log-log Derivative Plot with Model Match
- Figure 10 - Semi-log Horner Plot with Model Match
- Figure 11 - Daily Injection Rate History for Month Prior to Test Plot
- Figure 12 - Hall Plot

As specified by OCD requirements, a Hall Plot (Figure 12) generated from the data presented in Table 2 over the month leading up to the falloff test this year is presented. It is noted that this plot of a limited elapsed time of the Hall function is a simplistic presentation based on correcting average daily wellhead pressures to bottomhole conditions based on hydrostatic head and tubing friction loss. The plot has been made with this raw BHP rather than a pressure change (or dp) that would be generated by subtracting original reservoir pressure from the injection pressure value. Because this BHP value is used, the Hall plot slope is not proportional to other indicators, but qualitatively can yield insight to well conditions based on changing slopes. Further, consistent with the Hall method, it is assumed that the reservoir is homogenous and isotropic, that none of the average daily pressures are impacted by transient flow (relatively continuous, constant-rate injection took place), and that no offset wells are impacting pressure at this well during the time that the Hall function has been plotted. The slope of the data is fairly linear, and this linearity is consistent with no significant changes in well condition taking place during this time period. Based on this observed linear trend, there are no current concerns noted with regard to well or reservoir performance.

Table 5 contains all historical well test analysis results, including the results from the test this year.

All raw data generated by the test will be kept on file by HFNR for a period not less than five years. The raw data has been provided as a part of this report, with additional files available upon OCD request.

16. INTERNAL MECHANICAL INTEGRITY

On July 11, 2024, the annulus was bled down to 0 psi and then pressurized to approximately 600 psi to begin the test. The well had been shut in for approximately 50 hours prior to the annulus test, ensuring sufficient time for thermal equilibrium. A calibrated mechanical pressure gauge (Palmer-Wahl, 1,000 psi, SN – 2401128.001) supplied by Petrotek was installed on the annulus at the wellhead. The well and test gauge were then isolated from the rest of the system and annulus pressure, injection pressure and injection rate were then monitored for a period of thirty minutes at 5-minute intervals. During the Part I internal mechanical integrity test the pressure decreased by 10. psi. Since a change of 10% (60 psi) of the starting test pressure is allowable, this test is within acceptable specifications. Furthermore, pressure data had stabilized at the end of the test.

Released to Imaging: 5/19/2025 1:24:19 PM

Received by OCD: 8/11/2024 11:47:47 AM

Attachment 2 presents a copy of the gauge certification. Pressures observed during the test are shown in Table 6 and the pressure gauge chart record of the APT is presented as Attachment 3.

13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

July 21, 2024; Day 1: Begin constant-rate injection (+/- 10%) into GAINES WDW-3 as well as the three (3) offset wells for at least 30 hours prior to shut-in of WDW-3 for falloff testing. Target rate for WDW-3 is approximately 160 gpm. Wellhead pressure will not exceed 1,400 psig. Plant personnel will record rate, volume and pressure during the constant-rate injection period to ensure steady flow for analysis. Samples of the injectate will be collected approximately every 10 hours and analyzed for pH and specific gravity.
July 22, 2024; Day 2: Continue constant-rate injection into all four (4) wells.
July 23, 2024; Day 3: While injection continues, run dual downhole memory gauges to test depth making flowing gradient stopes every 2,000 feet. Collect pressure data at test depth for at least 1 hour while injecting at constant rate. Shut in WDW-3 and collect falloff data for a minimum of 30 hours. As operationally feasible, WDW-1, WDW-2 and WDW-4 to continue injection at constant rate until downhole memory gauges are pulled from WDW-3.
July 24, 2024; Day 4: WDW-3 will remain shut-in while collecting falloff pressure data using downhole memory gauges.
July 25, 2024; Day 5: After a minimum of 30 hours of falloff data collection, remove gauges from the well making 5-minute gradient stops every 2,000 feet. Note the top of fill will be tagged either with gauges prior to pulling from the well, or on a second run with sinker bars after gauges are removed (TBD). Conduct MIT for a minimum of 30 minutes recording data electronically. Rig down wireline and return well to service.

Petrotek

FESCO, Ltd. - Midland, TX
District Manager: Michael Carnes
Phone: 432-332-3211
Email: Michael.Carnes@FescoInc.com
==========
Company: Petrotek Corporation
Well Name: Navajo Refining Waste Disposal Well No. 3
Field Name: Davonia
Location: Eddy, NM
Formation: Unavailable
Test Date: 07/09/2024 - 07/11/2024
Gauge SN: DC-224831
Gauge Range: 15000 psi
FESCO File Ref: J202407121402001A-DC224831.xlsx

Comment

Powered up gauge.

Pressured up lubricator.

RIH making injecting gradient stops.

Arrived at 2000 ft stop.

Left 2000\ ft stop.

Arrived at 4000 ft stop.

Left 4000 ft stop.

Arrived at 6000 ft stop.

Left 6000 ft stop.

Arrived at 7572 ft stop.

7572 ft stop.

Reduced injection rate

Shut in well for 44-hr falloff test.

POOH making static gradient stops.

Arrived at 6000 ft stop.

Left 6000 ft stop.

Arrived at 4000 ft stop.

Left 4000 ft stop.

Arrived at 2000 ft stop.

Left 2000 ft stop.

Gauge at surface.

Closed crown valve.

Pressured down lubricator.

Test completed.

Powered down gauge.

COMMENTS

Created By	Comment	Comment Date
cchavez	Based on the FOT Report, OCD deems the FOT to be acceptable for the following reasons: a. High injection rate; b. Steady state injection flow rate (~ 7% variation); c. Instantaneous shut-in observed at the onset FOT monitoring with a pressure differential exceeding 100 psi; d. FOT radial flow conditions appear to have been achieved; e. FOT results are consistent with historical FOT Models; f. FOT Plots adequately correlate with digital data; and g. Hall Plot indicates adequate permeability conditions persisted throughout the FOT.	5/19/2025

CONDITIONS

Created By	Condition	Condition Date
cchavez	Conditions of Approval: 1) A longer FOT monitoring period is required (i.e., at least 3 days); 2) Pressure Chart should include the entirety of the FOT from the start of injection; 3) To accommodate No. 2 above, the BHG needs to be installed prior to running the FOT; 4) Future Horner Plots “Superposition” shall conform to FOT standards, i.e., semi-log with proper “Ordinate and Abscissa”; 5) The flow rate plot shall be to scale and reflect the period of the FOT in order to discern key information; and 6) O&M of the well should include a well cleaning and reservoir stimulation at least every 3 years prior to running a scheduled FOT.	5/19/2025
