Report for the Month ending February 28, 2025 Pursuant to Workover C-103 for Linam AGI #1 and AGI #2

This is the 154th monthly submittal of data as agreed between DCP and OCD relative to injection pressure, TAG temperature, casing annulus pressure, and bottom hole data for Linam AGI #1. Since the data for both wells provide the best overall picture of the performance of the AGI system, the data for both wells are analyzed and presented herein even though that analysis is required only on a quarterly basis for AGI #2.

All flow this month was directed to AGI #2. Injection parameters being monitored for AGI #1 (currently static) were as follows (Figures 1, 2, 3, 4): Average Injection Rate: 0 scf/hr, Average TAG Injection Pressure: 1,101 psig, Average TAG Temperature: 60°F, Average Annulus Pressure: 290 psig, Average Pressure Differential: 810 psig. Bottom hole (BH) sensors provided the average BH pressure for the entire period of 4,057 psig and BH temperature of 138 °F (Figures 8 and 9). The BH pressure quickly responded to the switchover to AGI #2. This is a very good indication of the continued resilience of the injection zone and the excess capacity available for TAG at current injection rates. AGI #1 performed a successful MIT on 2/20/2025, exhibiting no mechanical integrity issues.

The recorded injection parameters for AGI #2 for the month were: Average Injection Rate 156,315 scf/hr (AGI #2 was the only well used this month), Average Injection Pressure: 1,324 psig, Average TAG Temperature: 98°F, Average Annulus Pressure: 42 psig (minor leak detected in surface flange), average Pressure Differential: 1,283 psig (Figures 5, 6, 7). The AGI #2 well was unable to perform a satisfactory MIT on 2/20/2025. Annular pressure decreases over 10% were observed after three attempts, and it was determined that there is a possible leak on the main annular space valve, where the wellhead showed signs of possible leakage. Based on these findings, it was determined all flow should be directed to AGI #1 beginning March 1, while the wellhead valves are inspected and repaired as needed on AGI #2. Another MIT will be scheduled for AGI #2 in the near future to ensure the well can continue to permanently sequester TAG.

The Linam AGI #1 and AGI #2 wells are serving as a safe, effective, and environmentally friendly system to dispose of, and permanently sequester, Class II wastes consisting of H_2S and CO_2. The Linam AGI Facility permanently sequestered 4,346 Metric Tons of CO_2 for this month (Figure 10). The two wells provide the required redundancy to the plant that allows for operation with disposal to either or both wells. I hereby certify that the information above is true and complete to the best of my knowledge and belief.
