NOTICE OF INTENTION TO:

PERFORM REMEDIAL WORK ☐PLUG AND ABANDON ☐TEMPORARILY ABANDON ☐CHANGE PLANS ☐PULL OR ALTER CASING ☐MULTIPLE COMPL ☐DOWNHOLE COMMINGLE ☐OTHER: ☐

SUBSEQUENT REPORT OF:

REMEDIAL WORK ☐ALTERING CASING ☐COMMENCE DRILLING OPNS. ☐P AND A ☐CASING/CEMENT JOB ☐OTHER: Monthly Report pursuant to Workover C-103 ☒

13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

Report for the Month ending August 31, 2025 Pursuant to Workover C-103 for Linam AGI #1 and AGI #2

This is the 160th monthly submittal of data as agreed between DCP and OCD relative to injection pressure, TAG temperature, casing annulus pressure, and bottom hole data for Linam AGI #1. Since the data for both wells provide the best overall picture of the performance of the AGI system, the data for both wells are analyzed and presented herein even though that analysis is required only on a quarterly basis for AGI #2. On August 27, 2025, a successful MIT was completed on Linam AGI #1, verifying the well can continue to safely and effectively dispose of acid gas from the Linam AGI Facility.

All flow was directed to AGI #1 for the entirety of August. Injection parameters being monitored for AGI #1 (used exclusively for the month) were as follows (Figures 1, 2, 3, 4): Average Injection Rate: 184,392 scf/hr, Average TAG Injection Pressure: 1,646 psig, Average TAG Temperature: 123°F, Average Annulus Pressure: 22 psig, Average Pressure Differential: 1,624 psig. Bottom hole (BH) sensors provided the average BH pressure for the entire period of 4,307 psig and BH temperature of 140 °F (Figures 8 and 9).

The recorded injection parameters for AGI #2 for the month were: Average Injection Rate 0 scf/hr (No flow to AGI #2 for the month), Average Injection Pressure: 1,146 psig, Average TAG Temperature: 94°F, Average Annulus Pressure: 277 psig, average Pressure Differential: 869 psig (Figures 5, 6, 7). The wells responded positively to the switchover in flow to AGI #1, and all injection parameters show the correlative behavior of annular pressure with flowrate and injection pressure with temperature, confirming the wells are functioning properly.

The Linam AGI #1 and AGI #2 wells are serving as a safe, effective, and environmentally friendly system to dispose of, and permanently sequester, Class II wastes consisting of H₂S and CO₂. The Linam AGI Facility permanently sequestered 5,673 Metric Tons of CO₂ for this month (Figure 10). The two wells provide the required redundancy to the plant that allows for operation with disposal to either or both wells. I hereby certify that the information above is true and complete to the best of my knowledge and belief.
