PERFORM REMEDIAL WORK <input type="checkbox"/>	PLUG AND ABANDON <input type="checkbox"/>	REMEDIAL WORK <input type="checkbox"/>	ALTERING CASING <input type="checkbox"/>
TEMPORARILY ABANDON <input type="checkbox"/>	CHANGE PLANS <input type="checkbox"/>	COMMENCE DRILLING OPNS. <input type="checkbox"/>	P AND A <input type="checkbox"/>
PULL OR ALTER CASING <input type="checkbox"/>	MULTIPLE COMPL <input type="checkbox"/>	CASING/CEMENT JOB <input type="checkbox"/>	
DOWNHOLE COMMINGLE <input type="checkbox"/>			
OTHER: <input type="checkbox"/>		OTHER: Monthly Report pursuant to Workover C-103 <input checked="" type="checkbox"/>	

13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

## Report for the Month ending May 31, 2025 Pursuant to Workover C-103 for Linam AGI #1 and AGI #2

This is the 157<sup>th</sup> monthly submittal of data as agreed between DCP and OCD relative to injection pressure, TAG temperature, casing annulus pressure, and bottom hole data for Linam AGI #1. Since the data for both wells provide the best overall picture of the performance of the AGI system, the data for both wells are analyzed and presented herein even though that analysis is required only on a quarterly basis for AGI #2.

All flow was directed to AGI #1 for the entirety of May. Injection parameters being monitored for AGI #1 (used exclusively for May) were as follows (Figures 1, 2, 3, 4): Average Injection Rate: 160,064 scf/hr, Average TAG Injection Pressure: 1,483 psig, Average TAG Temperature: 109°F, Average Annulus Pressure: 8 psig, Average Pressure Differential: 1,475 psig. Bottom hole (BH) sensors provided the average BH pressure for the entire period of 4,249 psig and BH temperature of 135 °F (Figures 8 and 9).

The recorded injection parameters for AGI #2 for the month were: Average Injection Rate 0 scf/hr (No flow to AGI #2 for the month), Average Injection Pressure: 1,115 psig, Average TAG Temperature: 87°F, Average Annulus Pressure: 298 psig, average Pressure Differential: 818 psig (Figures 5, 6, 7). The wells responded positively to the switchover in flow to AGI #1, and all injection parameters show the correlative behavior of annular pressure with flowrate and injection pressure with temperature, confirming the wells are functioning properly. A plant-wide outage resulting from an electrical storm caused a brief cessation of injection from AGI #1 beginning the night of May 5, with injection resuming to normal operational conditions by midday on May 7.

The Linam AGI #1 and AGI #2 wells are serving as a safe, effective, and environmentally friendly system to dispose of, and permanently sequester, Class II wastes consisting of H<sub>2</sub>S and CO<sub>2</sub>. The Linam AGI Facility permanently sequestered 4,927 Metric Tons of CO<sub>2</sub> for this month (Figure 10). The two wells provide the required redundancy to the plant that allows for operation with disposal to either or both wells. I hereby certify that the information above is true and complete to the best of my knowledge and belief.
