**GENERAL INFORMATION :**

- State of New Mexico lease VB-1185-0001 covers 317.84 acres, being the W/2 of Section 31 in Township 24 South, Range 33 East, Lea County, New Mexico

- State of New Mexico lease VB-1193-0001 covers 320.00 acres being the E/2 of Section 31 in Township 24 South, Range 33 East, Lea County, New Mexico
- The central tank battery to service the subject wells is located in the E/2 SW/4 (Units K and N) of Section 31-24S-33E on State of New Mexico Lease VB-1185-00001.
- An application to commingle production from the subject wells is being submitted to the NMOCD and the New Mexico State Land Office.
- Enclosed herewith is (1) a map that displays the leases, the location of the subject wells, and the proposed CTB, (2) a process flow diagram, (3) and the C-102 plat for each of the wells.

### **FUTURE ADDITIONS**

Pursuant to Statewide rule 19.15.12.10(C)(4)(g) EOG Resources, Inc. respectfully requests the option to include additional pools or leases within the defined parameters set forth in the order for future additions.

### **PROCESS AND FLOW DESCRIPTIONS:**

The production from each well will flow into a dedicated 3-phase separator. The production stream will be separated into 3 independent streams (gas, oil, and water) by the separator and each stream will be measured individually after it exits the separator. The gas will be measured using a senior orifice meter before flowing into a common header. Gas is allocated to the wells on a mass balance basis based off of routine gas sampling at these meters. *Gas measurements on the high pressure separator are aligned with API MPMS 20.1*

The water will be measured using a Coriolis meter. The water from each separator is combined in a common header and flows into (2) 750 barrel coated steel tanks. Guided wave radar is used to measure water volumes in these tanks. The oil from each separator will be combined into a common header and flow into a heated 3-phase separator to aid separation of water entrained in the oil.

*Gas from the heated separator is measured and allocated back to the wells on an oil volume based allocation.*

Taipan/Adder 31 St STATE CTB FG #2 gas allocation meter is (S/N 14078942)

Water from the heated separator flows into the common water header connected to the (2) 750 barrel water tanks. The water is then pumped and/or trucked to a salt water disposal well.

The oil from the heated 3-phase separator flows through a vapor recovery tower (VRT) where gas is allowed to breakout at a lower pressure, and then the oil flows into (4) 750 barrel coated steel tanks. Guided wave radar is used to measure water and oil volumes in these tanks and can be used for volume verification during diagnosis of upset conditions. Oil is pumped out of the tanks through a LACT with Coriolis measurement into a truck or a pipeline. The LACT is the custody transfer point and the measurement point for oil sales. Tank vapors are sent to flare

and are quantified based on a Promax process model. Tank vapors are allocated back to wells on an oil volume based allocation.

After the gas from each separator is measured it is combined into a common header. The gas from the heated 3-phase separator also flows into this header. The gas flows through the header to a custody transfer senior orifice meter (S/N 14078971). If the pipeline is experiencing problems and cannot take any gas, the gas will flow through the produced gas emergency flare meter (S/N 140789956) to the flare. If an individual well needed to be flared for any operational reason it will be manually routed through the individual well flare meter (S/N 14078957) to the flare. The overhead gas from the vapor recovery tower is compressed by an electric drive vapor recovery compressor and then measured by a custody transfer senior orifice meter (S/N 14078986). The gas from the vapor recovery system combines with the gas from the lease production meter and flows into our gas gathering pipeline system. . Fuel gas being consumed by the heated vessels is pulled off of the common gas header before being metered by the custody transfer meter. This gas is pulled at a common point and measured using a thermal mass meter and allocated back to wells on a mass balance basis. Gas lift gas being used by each well is measured and subtracted from their production on a mass balance basis.
