**RE: ANNUAL MONITORING, OPERATION AND MAINTENANCE REPORT
MARCH 2009 THROUGH FEBRUARY 2010
ConocoPhillips East Hobbs Junction (AP-15)
Hobbs, Lea County, New Mexico**

Dear Mr. VonGonten:

Pursuant to operations and monitoring requirements for the East Hobbs Junction remediation site, please find one copy of the above referenced report for your review and concurrence. This report presents an annual summary of all site activities performed from March 2009 through February 2010 relating to the operation, maintenance and monitoring of the remediation system, quarterly groundwater monitoring, and sampling and analyses.

If you have any questions or comments, please contact me at the above listed number or Greg W. Pope with Tetra Tech at (432) 682-4559.

Sincerely,

Tom Wynn
Site Manager

**RE: ANNUAL MONITORING, OPERATION AND MAINTENANCE REPORT
MARCH 2009 THROUGH FEBRUARY 2010
ConocoPhillips East Hobbs Junction (AP-15)
Hobbs, Lea County, New Mexico**

INTRODUCTION

On behalf of ConocoPhillips, formerly Phillips Pipe Line Company, Tetra Tech (formerly Maxim Technologies; Maxim) is submitting the following annual status report for the East Hobbs Junction remediation site (Site). The Site is located in Lea County, New Mexico (Sec 8, T19S, R38E; Figure 1), approximately one mile south of the city of Hobbs. The work described in this report was performed in accordance with the Stage 2 Ground Water Abatement Plan (AP-15) issued for the Site and approved by the New Mexico Oil Conservation Division (NMOCD). A request for extension of the submittal date for this report to April 30, 2010 was submitted to the NMOCD and approved via electronic mail on March 22, 2010; however, additional time was required to complete this report. This report is a summary of the following activities performed from March 2009 through February 2010:

- Groundwater Monitoring and Sampling
- Free Petroleum Hydrocarbon Gauging, Recovery and Disposal
- Remediation System Operation and Maintenance

During this time period, no new groundwater monitoring wells or remediation wells were installed at the Site. Volatile organic compound (VOC) removal rates by the soil vapor extraction (SVE) system have decreased over time to an ineffective level for remediation of the crude oil plume. On August 5, 2008, the SVE and air sparging systems were converted into a bioventing system utilizing electronic timers to cycle the periods of operation to promote oxygen enhancement in the vadose zone and encourage biodegradation. After initial startup procedures and timer calibration were completed, continuous operation of the bioventing system began on August 20, 2008.

This report also presents four quarters of groundwater monitoring data collected in April, July and October 2009, and January 2010.

BACKGROUND

Project activities commenced at the Site in January of 2000, following the discovery of a release of crude oil from a gathering line at the East Hobbs Junction. Assessment and remediation activities have been conducted at the Site to define and address the crude oil impacts including the installation of a comprehensive soil and groundwater remediation system. The remediation system installation consisted of a SVE system, an air sparging system, and expanding the existing crude oil recovery system. Figure I illustrates the locations of the existing pipeline corridors, the Site monitoring and remediation wells, and the remediation system buildings and oil storage tank.

Higgins and Associates, L.L.C. (H&A) of Centennial, Colorado performed the installation of the remediation system, initial startup procedures, system operation and maintenance, and required Site monitoring activities until September 2003. On September 24, 2003, Maxim (presently Tetra Tech) assumed operation and maintenance of the system, and continued the required Site monitoring activities.

HEALTH AND SAFETY

Tetra Tech required safety and health procedures that were appropriate for the level of environmental hazard known to exist at the Site. Procedures used complied with ConocoPhillips' "Contractors Health and Safety Standard" (revised 2010). Modified Level D Personal Protective Equipment (PPE) was adequate for the Site activities. Personnel were equipped with respirators and organic vapor cartridges in the event of a sudden release of noxious fumes from the Site. Prior to commencement of work, a Site Specific Health and Safety Plan (HASP) was prepared by Tetra Tech. The HASP was reviewed and signed by all personnel working at the Site. Safety procedures were reviewed during tailgate safety meetings conducted prior to the start of work each day.

GROUNDWATER MONITORING AND SAMPLING

Quarterly groundwater monitoring and sampling activities were conducted at the Site on April 21-22, July 28-29 and October 27-28, 2009, and January 26-27, 2010. Accessible monitoring, recovery and remediation wells were measured for groundwater elevations prior to the sampling events. Wells containing free petroleum hydrocarbons were not sampled. On April 21 and 22, 2009, wells MW-4 through 6, MW-12 through 27, and SVE-10 were sampled. On July 28-29 and October 21-22, 2009, and January 26-27, 2010, wells MW-2 through 6, MW-11 through 27, and SVE-10 were sampled. The groundwater samples were collected into appropriate sample containers, placed in a cooler packed with ice, and shipped under chain-of-custody to an approved laboratory for analysis of total petroleum hydrocarbons-diesel range organics (TPH-DRO) and total petroleum hydrocarbons-gasoline range organics (TPH-GRO) by Method 8015B modified, benzene, toluene, ethylbenzene and total xylenes (BTEX) by Method 8021B, and chloride by Method 300.0A.

Groundwater elevation measurements are summarized in Table I. Potentiometric surface maps for each of the four sampling events are included as Figures 2a, 2b, 2c and 2d. Groundwater flow direction is variable across the Site, and depending on location, can be to the west, southwest, south, or southeast. The overall groundwater flow direction was calculated and shows to be southwest at an average gradient ranging from 0.0014 feet per foot (ft/ft) in April 2009 to 0.0021 ft/ft in October 2009. Groundwater levels at the Site generally peaked in 2006, as shown on the hydrographs included in Appendix A, and have shown a decreasing trend overall since. A majority of the wells have now reached the lowest groundwater levels historically recorded since the wells were installed.

Groundwater analytical results for the April, July, and October 2009, and January 2010 sampling events are presented in Tables 2a, 2b, and 2c, and graphically displayed on Figures 3a, 3b, 3c and 3d. The laboratory analytical data is included in Appendix B. Analytical results from the groundwater monitoring events show that the lateral extent of the dissolved-phase plume remains defined in all directions. Minor detections were noted in a few of the perimeter wells, with TPH-DRO occasionally being reported at very low concentrations.

In the interior wells, concentrations of BTEX, TPH-GRO and TPH-DRO decreased overall in wells MW-2, MW-5, MW-6, MW-15, MW-24, MW-27 and SVE-10, and remained generally consistent in wells MW-3, MW-11, MW-12 and MW-18. During the reporting time frame, the

highest concentration of benzene was reported in well MW-2 at 15,000 micrograms per liter ($\mu\text{g}/\text{L}$; July 2009). This well reported a benzene concentration at 1.3 $\mu\text{g}/\text{L}$ during the January 2010 sampling event, but was not sampled during the April 2009 sampling event due to the presence of measurable liquid phase hydrocarbons (LPH). Subsequent decreases in toluene (2,000 to 1.1 $\mu\text{g}/\text{L}$), ethylbenzene (640 to 11 $\mu\text{g}/\text{L}$), total xylenes (1,540 to 1.1 $\mu\text{g}/\text{L}$), TPH-GRO (62 to 0.71 milligrams per liter [mg/L]), and TPH-DRO (10 to 2.2 mg/L) were also reported in MW-2 between July 2009 and January 2010 (Table 2a).

FREE PETROLEUM HYDROCARBON GAUGING

Free-phase petroleum hydrocarbons were measured in selected wells during each of the four monitoring events, and weekly measurements are recorded at wells MW-7, MW-8 and MW-10 to monitor any crude oil recharge into these wells. Isopleth maps depicting LPH thickness for April, July and October 2009, and January 2010 are included as Figures 4a, 4b, 4c and 4d, respectively, and LPH measurements are summarized in Table I.

During the April through October 2009 sampling events, the crude oil recovery wells recorded none to very thin measurable LPH (0.01 feet), with no wells showing measurable LPH in July 2009. During January 2010, only MW-9 recorded a measurable LPH thickness at 1.28 feet, which seems to be a very anomalous measurement since only 0.01 feet was measured in October 2009 and none was recorded during the two previous events. As previously discussed, groundwater levels at the Site have shown a continual decrease over time, and a majority of the wells have now reached the lowest groundwater levels historically recorded since the wells were installed, below the maximum low stand in 2004 when LPH was last measured at recoverable thicknesses. Depiction of each well's LPH plume thickness and groundwater level is shown on the hydrographs in Appendix A.

FREE PETROLEUM HYDROCARBON RECOVERY

Due to the reduced LPH plume thickness described above, no crude oil recovery was performed at the Site during March 2009 through February 2010, and the skimmer pumps have been removed from the wells to facilitate groundwater and LPH measurement access. From initial abatement activities and previous oil removal activities, approximately 398 barrels of crude oil have been recovered through February 2010.

TETRA TECH, INC.

During the June 2005 meeting with the NMOCD in Santa Fe, a rule of thumb was established that assumed 0.5 feet of crude oil thickness would be used as criteria for returning a recovery well to operation. During the time frame of this report, no recovery wells have met these criteria. Also, no disposal activities were performed at the Site during March 2009 through February 2010.

SOIL VAPOR EXTRACTION AND AIR SPARGING SYSTEMS MONITORING

The SVE system has been operational since October 17, 2002. For air quality permit compliance, the on-site SVE system has been periodically monitored for effluent temperature, flow rate and VOC concentrations since startup. A photoionization detector (PID) is used in the field to measure VOCs as organic vapor in air in parts per million (ppm) at the blower exhaust stack. Effluent flow rates and PID readings have ranged from 849 to 875 cubic feet per minute, and from 0.0 to 663 ppm since startup. A summary of SVE emissions data is presented in Table 3, and graphical representation of the VOC measurements and emissions data are presented on Figure 5. As presented in Table 3, VOCs have shown a consistent declining trend, with concentrations dropping below 100 ppm in November 2004, and below 30 ppm in March 2005. Further decline in VOC concentrations continued until November 2005, when VOCs became non-detectable by the PID. Several inspections were performed on the SVE piping system, wellheads and valving to check for ambient air leaks which would contribute to the low to non-detect SVE concentrations, with no leaks being found. To check for any rebound of VOCs, the SVE system was shutdown on December 6, 2005 and then restarted on January 6, 2006. VOC concentrations were measured at 4.7 ppm on January 6, 2006, after the system was off for one month. Because no significant VOCs were measured after this time period, the SVE system was shut back down. The SVE system was restarted on September 14, 2006, when VOC concentrations were measured at 346 ppm. Since the restarting of the SVE unit in September 2006, VOC concentrations have once again shown a consistent declining trend, measuring 23.5 ppm on February 12, 2008.

On August 5, 2008, the SVE and air sparging systems were converted into a bioventing system utilizing electronic timers to cycle the periods of operation to promote oxygen enhancement in the vadose zone and encourage biodegradation. After startup procedures, system repairs and timer calibration were completed, continuous operation of the bioventing system began on August 20, 2008. According to system design parameters, the air sparging operates by alternating air injection to each of the four well zones for four hours each, followed by an eight

hour latent period. The SVE operates by running concurrently with the air sparging plus two additional hours, followed by a six hour latent period. Well vacuum, groundwater dissolved oxygen (DO) readings, and air injection pressures are collected at the SVE wellheads and sparging manifolds to monitor the effectiveness of the bioventing conversion. Consistent DO data collected since January 2009, utilizing a downhole operated YSI ProODO™ optical DO instrument, have shown a cyclic response in the groundwater DO through February 2010, with alternating increases and decreases in the DO measured in the wells. Well vacuum and SVE effluent VOC concentration readings are presented in Table 4. Groundwater DO and temperature measurements in select wells are presented in Table 5.

Approximately 56,916 pounds (~28.4 tons) of VOCs have been removed from the vadose zone by the SVE system since startup on October 17, 2002 through February 2010. The yearly total of VOCs removed by SVE from March 2009 through February 2010 was approximately 3.6 tons. The removal of VOCs by the SVE system has shown a consistent decrease from the 11.45 tons removed during the first year of operation at the initial startup in October 2002 through October 2003. However, VOC removal rates have increased during March 2009 through February 2010 due to the bioventing operations. The Site is permitted by the New Mexico Air Quality Board for a maximum VOC extraction rate of 15 tons per year.

SYSTEM OPERATION AND MAINTENANCE

The remediation system equipment operation and maintenance schedule was performed according to manufacture recommendations and included oil and oil filter changes, air filter replacement, motor bearing lubrication and air/oil separator maintenance on the Sullivan/Palatek 20D air compressor; lubrication of the bearings and oil changes on the Roots SVE blower; replacement of fuses and indicator bulbs on the system control panel as needed; monitoring and replacement/repair of gauges, fittings, and wellhead assemblies; and routine monitoring of all system fittings, hoses, sight glasses, gauges, valves, seals, lines, bearings, control switches and solenoids. The operation and maintenance schedule also included recording the system gauge and timer readings into a table for monitoring of system functions over time.

CONCLUSIONS

Based on the data presented in this report, the following conclusions can be determined:

- Groundwater sampling results indicate a decrease of BTEX, TPH-GRO and TPH-DRO concentrations in wells MW-2, MW-5, MW-6, MW-15, MW-24, MW-27 and SVE-10, and the concentrations remained generally consistent in wells MW-3, MW-11, MW-12 and MW-18. Analytical results from the groundwater monitoring events show that the lateral extent of the dissolved-phase plume remains defined in all directions. Minor detections were noted in a few of the perimeter wells, with TPH-DRO occasionally being reported at very low concentrations.
- Approximately 56,916 pounds (~28.4 tons) of VOCs have been removed from the vadose zone by the SVE system since startup on October 17, 2002 through February 2010. The yearly total of VOCs removed by SVE from March 2009 through February 2010 was approximately 3.6 tons. The removal of VOCs by the SVE system has shown a consistent decrease from the 11.45 tons removed during the first year of operation at the initial startup in October 2002 through October 2003. However, VOC removal rates have increased during March 2009 through February 2010 due to the bioventing operations.
- The SVE and air sparging systems were converted into a bioventing system on August 5, 2008. After startup procedures and timer calibration were completed, continuous operation of the bioventing system began on August 20, 2008. Consistent DO data collected since January 2009 have shown have shown a cyclic response in the groundwater DO through February 2010, with alternating increases and decreases in the DO measured in the wells.
- Groundwater levels at the Site have shown a continual decrease over time, with a majority of the wells now showing the lowest groundwater levels historically recorded since the wells were installed.
- During the April through October 2009 sampling events, the crude oil recovery wells recorded none to very thin measurable LPH (0.01 feet), with no wells showing measurable LPH in July 2009. During January 2010, only MW-9 recorded a measurable LPH thickness at 1.28 feet, which seems to be a very anomalous measurement since only 0.01 feet was measured in October 2009 and none was recorded during the two previous events.
- Due to the reduced LPH plume thickness, no crude oil recovery was performed at the Site during March 2009 through February 2010, and the skimmer pumps have been removed from the wells to facilitate groundwater and LPH measurement access. From

initial abatement activities through February 2010, the crude oil recovery system has recovered approximately 398 barrels of crude oil.

RECOMMENDATIONS

Based on the results and conclusions presented in this report, the following recommendations are presented:

- Continue close monitoring of the groundwater levels and LPH plume thickness with the purpose of restarting the crude oil skimmer system if recoverable LPH is observed in the recovery wells.
- Continue operation and monitoring of the converted bioventing system.

Should you have any questions or comments upon review of this report, please contact Mr. Tom Wynn, ConocoPhillips Site Manager, at (918) 661-0310 or myself at (432) 682-4559.

Sincerely,

TETRA TECH

Notes:

L.P.H = Liquid Phase Hydrocarbons

NM = Not Measured

Blank Fields Indicate No Data

Same Measurements of L.P.H. and Water Indicate a Sheen is Present

Notes:

$\mu\text{g/L}$ = micrograms per liter

mg/L = milligrams per liter

BDL = below detection limit

TPH-GRO = Total Volatile Petroleum Hydrocarbons (TVPH)

TPH-DRO = Total Extractable Petroleum Hydrocarbons (TEPH)

D = duplicate sample

Notes:

$\mu\text{g/L}$ = micrograms per liter

TPH-GRO = Total Volatile Petroleum Hydrocarbons (TVPH)

mg/L = milligrams per liter

TPH-DRO = Total Extractable Petroleum Hydrocarbons (TEPH)

NA= not analyzed

D = Duplicate Sample

| 02/22/10 | 2345 | 92.2 | 875 | 17.63 | 17.63 | 246.78 | 56916.19 | 14 | | | | | |
| Estimated avg lbs/day removed (2002-2003): | | | | 110.72 | Total tons VOCs removed (Oct 2002 - Oct 2003): | | | | 11.45 | | | | |
| Estimated avg lbs/day removed (2003-2004): | | | | 45.75 | Total tons VOCs removed (Feb 2004 - Feb 2005): | | | | 4.62 | | | | |
| Estimated avg lbs/day removed (2004-2005): | | | | 16.81 | Total tons VOCs removed (Feb 2005 - Dec 2005): | | | | 0.60 | | | | |
| Estimated avg lbs/day removed (2006-2007): | | | | 30.13 | Total tons VOCs removed (Jan 2006 - Feb 2007): | | | | 1.70 | | | | |
| Estimated avg lbs/day removed (2007-2008): | | | | 11.64 | Total tons VOCs removed (Feb 2007 - Mar 2008): | | | | 2.16 | | | | |
| Estimated avg lbs/day removed (2008-2009): | | | | 9.28 | Total tons VOCs removed (Mar 2008 - Feb 2009): | | | | 1.54 | | | | |
| Estimated avg lbs/day removed (2009-2010): | | | | 20.19 | Total tons VOCs removed (Mar 2009 - Feb 2010): | | | | 3.60 | | | | |
| Estimated total pounds VOCs removed: | | | | 56,916.19 | Cumulative tons VOCs removed since startup: | | | | 28.46 | | | | |
| Notes and Calculations: | | | | | | | | | | | | | |
| VOC Discharge (lbs/day) = ((Co (ppm)*(78 g/mole)/24.05)*(1 g/1000 mg)*(1 m ³ /35.31 cf)*(1 lb/454 g)*(Q (scfm)*operating min/day)) | | | | | | | | | | | | | |
| Where: Co = Average Effluent VOC concentration (ppm) from previous time period | | | | | Q = flow rate of effluent air (scfm) | | | | | | | | |
| | | | | | 24.05 = gas law constant | | | | | | | | |

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report (" mg\kg-dry " or " ug\kg-dry ").

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Due to limited sample volume, a Matrix Spike (MS) or Matrix Spike Duplicate (MSD) was not extracted with Batch IDs: EXTO/1263 and EXTO/1265 for the Diesel Range Organics analysis by Method 8015. A Laboratory Control Sample (LCS) and a Laboratory Control Sample Duplicate (LCSD) were extracted with the analytical batch and serve as the batch quality control (QC). The LCS and LCSD recovered acceptably and precision criteria were met.

Your sample ID "MW-16" (SPL ID: H09040519002) was randomly selected for use in SPL's quality control program for the Total Chloride analysis by EPA Method 300. The Matrix Spike Duplicate (MSD) recovery was outside of the advisable quality control limits for Batch ID: IC/1068 due to matrix interference. A Laboratory Control Sample (LCS) was analyzed as a quality control check for the analytical batch and all recoveries were within acceptable limits.

Some of the percent recoveries and RPD's on the QC report for the MS/MSD may be different than the calculated recoveries and RPD's using the sample result and the MS/MSD results that appear on the report because, the actual raw result is used to perform the calculations for percent recovery and RPD.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above Certificate of Analysis Number.

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

MATRIX SPIKE & MATRIX SPIKE DUPLICATE: 12444 12445 Original: H09040519022

MS Analysis Date/Time Analyst: 04/25/2009 11:11 WLV

MSD Analysis Date/Time Analyst: 04/25/2009 11:40 WLV

| Parameter | Units | Original Result | Spike Conc. | MS Result | MSD Result | MS % Rec | MSD % Rec | % Rec Limit | RPD | Max RPD |
|--------------------------|-------|-----------------|-------------|-----------|------------|----------|-----------|-------------|-----|---------|
| 1,4-Difluorobenzene (S) | % | 98.6 | | | | 99.8 | 99.7 | 70-130 | | 30 |
| 4-Bromofluorobenzene (S) | % | 96.8 | | | | 99.6 | 99.3 | 70-130 | | 30 |

QC results presented in the QC Control Data have been rounded. RPD and percent recovery values calculated by the SPL LIMS system are derived from QC data prior to the application of rounding rules. Also, MS/MSD % recoveries are calculated by the SPL LIMS using any detected value greater than the MDL.

Legend

(S) - Indicates analyte is a surrogate

| Qualifier | Qualifier Description |
|-----------|---|
| * | Recovery/RPD value outside QC limits |
| B | Analyte detected in the Method Blank |
| C | MTBE results were not confirmed by GCMS |
| D | Recovery out of range due to dilution |
| E | Results exceed calibration range |
| H | Exceeds holding time |
| I | Estimated value, between MDL and PQL (Florida) |
| J | Estimated value |
| JN | The analysis indicates the presence of an analyte |
| MI | Matrix Interference |
| N | Recovery outside of control limits |
| NC | Not Calculable (Sample Duplicate) |
| NC | Not Calculated - Sample concentration > 4 times the spike |
| P | Pesticide dual column results, greater than 25% |
| Q | Received past holding time |

Sample Receipt Checklist

| | | | |
|---------------|------------------|---------------|-----------|
| WorkOrder: | H09040519 | Received By | LOG |
| Date and Time | 04/23/2009 10:00 | Carrier Name: | FEDEXS |
| Temperature: | 3.5°C | Chilled By: | Water Ice |

1. Shipping container/cooler in good condition? YES
2. Custody seals intact on shipping container/cooler? YES
3. Custody seals intact on sample bottles? Not Present
4. Chain of custody present? YES
5. Chain of custody signed when relinquished and received? YES
6. Chain of custody agrees with sample labels? YES
7. Samples in proper container/bottle? YES
8. Samples containers intact? YES
9. Sufficient sample volume for indicated test? YES
10. All samples received within holding time? YES
11. Container/Temp Blank temperature in compliance? YES
12. Water - VOA vials have zero headspace? YES
13. Water - Preservation checked upon receipt(except VOA*)? Not Applicable

*VOA Preservation Checked After Sample Analysis

I. SAMPLE RECEIPT:

All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II: ANALYSES AND EXCEPTIONS:

Per the Conoco Phillips TSM Revision 0, a copy of the internal chain of custody is to be included in final data package. However, due to LIMS limitations, this cannot be provided at this time.

Due to limited sample volume, a Matrix Spike (MS) or Matrix Spike Duplicate (MSD) was not extracted with Batch IDs: 92499 and 92500 for the Diesel Range Organics analysis by Method 8015B. A Laboratory Control Sample (LCS) and a Laboratory Control Sample Duplicate (LCSD) were extracted with the analytical batch and serve as the batch quality control (QC). The LCS and LCSD recovered acceptably and precision criteria were met.

III. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report (" mg\kg-dry " or " ug\kg-dry ").

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Some of the percent recoveries and RPD's on the QC report for the MS/MSD may be different than the calculated recoveries and RPD's using the sample result and the MS/MSD results that appear on the report because, the actual raw result is used to perform the calculations for percent recovery and RPD.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above Certificate of Analysis Number.

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for

J - Estimated Value between MDL and PQL
E - Estimated Value exceeds calibration curve
TNTC - Too numerous to count

>MCL - Result Over Maximum Contamination Limit(MCL)
D - Surrogate Recovery Unreportable due to Dilution
MI - Matrix Interference

Laboratory Control Sample (LCS)

RunID: IC1_090803A-5141551 Units: mg/L

Analysis Date: 08/04/2009 11:40 Analyst: BDG

| Analyte | Spike Added | Result | Percent Recovery | Lower Limit | Upper Limit |
|----------|-------------|--------|------------------|-------------|-------------|
| Chloride | 10.00 | 9.392 | 93.92 | 85 | 115 |

Matrix Spike (MS) / Matrix Spike Duplicate (MSD)

Sample Spiked: 09071601-04

RunID: IC1_090803A-5141507 Units: mg/L

Analysis Date: 08/04/2009 2:33 Analyst: BDG

| Analyte | Sample Result | MS Spike Added | MS Result | MS % Recovery | MSD Spike Added | MSD Result | MSD % Recovery | RPD | RPD Limit | Low Limit | High Limit |
|----------|---------------|----------------|-----------|---------------|-----------------|------------|----------------|-------|-----------|-----------|------------|
| Chloride | 151.2 | 100 | 259.8 | 108.7 | 100 | 253.8 | 102.6 | 2.371 | 20 | 80 | 120 |

Qualifiers: ND/U - Not Detected at the Reporting Limit

MI - Matrix Interference

B/V - Analyte detected in the associated Method Blank

D - Recovery Unreportable due to Dilution

J - Estimated value between MDL and PQL

* - Recovery Outside Advisable QC Limits

E - Estimated Value exceeds calibration curve

N/C - Not Calculated - Sample concentration is greater than 4 times the amount of spike added. Control limits do not apply.

TNTC - Too numerous to count

QC results presented on the QC Summary Report have been rounded. RPD and percent recovery values calculated by the SPL LIMS system are derived from QC data prior to the application of rounding rules.

I. SAMPLE RECEIPT:

All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II: ANALYSIS AND EXCEPTIONS:

SW8015B - Diesel Range Organics analysis:

Due to limited sample volume, a Matrix Spike (MS) or Matrix Spike Duplicate (MSD) was not extracted for Batch ID: 95178 and 95251. A Laboratory Control Sample (LCS) and a Laboratory Control Sample Duplicate (LCSD) were extracted with the analytical batch and serve as the batch quality control (QC). The LCS and LCSD recovered acceptably and precision criteria were met.

EPA300 - Ion Chromatography:

Sample ID "MW-4, MW-20 and MW-15" (SPL ID: 09101443-01, 20, 24) were randomly selected for use in SPL's quality control program for Batch ID: R288640, R288640A and R288640B. The Matrix Spike (MS) and Matrix Spike Duplicate (MSD) recoveries were outside of the advisable quality control limits due to possible matrix interference. A Laboratory Control Sample (LCS) was analyzed as a quality control check for the analytical batch and all recoveries were within acceptable limits.

III. GENERAL REPORTING COMMENTS:

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Some of the percent recoveries and RPD's on the QC report for the MS/MSD may be different than the calculated recoveries and RPD's using the sample result and the MS/MSD results that appear on the report because, the actual raw result is used to perform the calculations for percent recovery and RPD.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

This report shall not be reproduced except in full, without the written approval of the laboratory. The reported results are only representative of the samples submitted for testing.

SPL, Inc. is pleased to be of service to you. We anticipate working with you in fulfilling all your current and future analytical needs.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or by his designee, as verified by the following signature.

I. SAMPLE RECEIPT:

All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II: ANALYSIS AND EXCEPTIONS:

Per the Conoco Phillips TSM Revision 0, a copy of the internal chain of custody is to be included in final data package. However, due to LIMS limitations, this cannot be provided at this time.

SW8015B - Diesel Range Organics analysis:

Due to limited sample volume, a Matrix Spike (MS) or Matrix Spike Duplicate (MSD) was not extracted for Batch ID: 97521/97524. A Laboratory Control Sample (LCS) and a Laboratory Control Sample Duplicate (LCSD) were extracted with the analytical batch and serve as the batch quality control (QC). The LCS and LCSD recovered acceptably and precision criteria were met.

EPA300.0- Ion Chromatography:

Sample ID "MW-27" (SPL ID: 10010953-01) was randomly selected for use in SPL's quality control program for Batch ID: R294670. The Matrix Spike Duplicate (MSD) recovery was outside of the advisory quality control limits due to possible matrix interference for Chloride. A Laboratory Control Sample (LCS) was analyzed as a quality control check for the analytical batch and all recoveries were within acceptable limits.

III. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report (" mg/kg-dry " or " ug/kg-dry ").

Matrix spike (MS) and matrix spike duplicate (MSD) samples are chosen and tested at random from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. Since the MS and MSD are chosen at random from an analytical batch, the sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The Laboratory Control Sample (LCS) and the Method Blank (MB) are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

Some of the percent recoveries and RPD's on the QC report for the MS/MSD may be different than the calculated recoveries and RPD's using the sample result and the MS/MSD results that appear on the report because, the actual raw result is used to perform the calculations for percent recovery and RPD.

Any other exceptions associated with this report will be footnoted in the analytical result page(s) or the quality control summary page(s).

Please do not hesitate to contact us if you have any questions or comments pertaining to this data report. Please reference the above
