**Engineering Summary**  
**Form C-107A**  
**Application for Downhole Commingling**

**Marbob Energy Corporation**  
**Oxy Pistachio RSG Federal No. 1**  
**Unit A-17-T17S-R31E**

Marbob Energy proposes to downhole commingle the Cisco Canyon and Wolfcamp zones in order to extend the economic life of these zones and maximize the economic benefit to New Mexico and the federal government. The estimated bottom hole pressures are within 10% of each other and the well will be beam pumped in a pumped down condition, therefore no crossflow will occur. There are no incompatibility problems with the oil and the value of the oil will not be affected by commingling.

Based on swab testing, the Cisco Canyon is initially expected to produce 72 bopd followed by a rapid decline. The best engineering estimate of reserves is 5,500 BO/11,400 MCF based on the Cisco Canyon production history of the nearby Oxy Butter Pecan Federal #1 (production plot attached).

Based on swab testing, the Wolfcamp, which is notorious for having limited reservoirs, is expected to produce 144 bopd followed by a rapid decline. The best engineering estimate is that the Wolfcamp will behave like the Oxy Butter Pecan Federal #1 did in the Cisco Canyon, except with a higher initial production rate. The Wolfcamp reserves are estimated to be 11,000 BO/22,800 MCF. It is expected that the GOR for each zone will be essentially the same.

The proposed allocation is:

$$\text{Wolfcamp oil} = \frac{11,000 \text{ BO}}{11,000 + 5,500 \text{ BO}} = 66.7\%$$

$$\text{Wolfcamp gas} = \frac{22,800 \text{ MCF}}{22,800 + 11,400 \text{ MCF}} = 66.7\%$$

$$\text{Cisco Canyon oil} = \quad \quad \quad = 33.3\%$$

$$\text{Cisco Canyon gas} = \quad \quad \quad = 33.3\%$$
