RE: Response to NMED's Notice of Disapproval, Remedy Completion Report, Railroad Rack Lagoon (SWMU No.8) Revised Report
Western Refining Company Southwest Inc., Gallup Refinery
EPA ID # NMD000333211 HWB-GRCC-06-001"

Dear Mr. Bearzi:

The purpose of this letter is to respond to the New Mexico Environment Department's (NMED), Notice of Disapproval, Remedy Completion Report, Railroad Rack Lagoon (SWMU No.8) Revised Report, dated October 2006 submitted on behalf of *Western Refining Company Southwest Inc., Gallup Refinery*.

NMED provided four comments in the Notice of Disapproval and they are listed below with Westerns response.

NMED Comment 1

The final dimensions (including all of the additional excavations and the excavation of the piping) are not clearly presented in the Report. The Permittee must present the excavation dimensions and provide a figure showing the dimensions and the locations of the final confirmation samples. The Permittee must demonstrate that the excavation of contaminated soil is complete.

Response to Comment 1

Please see the enclosed Figure 1 (dated 12/28/10) showing the dimensions and locations of the final confirmation samples.

NMED Comment 2

In Section 6 (Sampling Methods), page 19, paragraph two, the Permittee states "[a]fter the sample was removed, the excavator operator dumped the bucket back into the same spot the sample came from. Then the operator would excavate the next sample location. Doing so wiped

contamination from the bucket that might have resulted from the previous excavation sample point.” By returning the excavated soil to the excavation, the Permittee could have returned contaminated soil to the excavation. Also, it does not seem possible that the soil was returned to precisely the same location it was excavated, especially with regard to sidewall samples. While the excavator bucket does not necessarily need to be decontaminated between each sample location, excavating subsequent sample locations does not “wipe” the contamination from the last sample location from the bucket. In the future, the Permittee must not return soil to the excavation and must not consider use of the excavator bucket to remove soils to be a form of decontamination. No change is necessary for the Report.

Response to Comment 2

Comment 2 was noted and no change or response is necessary for this response.

NMED Comment 3

The Permittee was required to excavate soil to residential/industrial levels of DRO (200mg/kg); DRO was detected in one of the confirmation samples, RR-1A-91505, located along the north wall of south-east sidewall excavation of the pipeline at a concentration of 210 mg/kg. The Permittee must complete a boring from undisturbed native soils within 2 feet of the original sample location. Samples must be collected from the ground surface and at two-foot intervals to a depth of ten feet below the ground surface for a total of five samples. Samples sent to the laboratory for analysis must be the most contaminated samples based on field observations (e.g., odor, color), and from the total depth of the boring. The results of the sampling must be included in the supplemental report (see also Comment 1). If the samples contain concentrations of DRO that exceed the clean-up standards, additional excavation will be required. The Permittee must note that in order to meet the requirements of corrective action complete without controls, all confirmatory soil samples must be at or below the NMED cleanup levels (see *Technical Background Document for Development of Soil Screening Levels, Revision 5.0*, which is available online at http://www.nmenv.state.nm.us/hwb/documents/NMED_SSG_August_2009_Dec09TableA-1_clean.pdf).

Response to Comment 3

Upon further clarification in a letter from the NMED HWB dated December 17, 2010, Western Refining would like to seek corrective action complete without controls for the lagoon area. Western would like to request until March 1, 2011 to conduct the boring and sampling near RR-1A-91505 needed to comply with Comment 3. Western will also conduct a similar boring and sampling at sample location W-1-WALL-S which indicated a DRO of 310 mg/kg as shown on Figure 1.

NMED Comment 4

The Permittee does not provide the source of the clean backfill material. The Permittee must state the source of the clean backfill and provide analytical data that demonstrates that the fill is clean if the material was obtained from within the refinery.

Response to Comment 4

Mr. James P. Bearzi

September 9, 2010

Page 3

Backfill material was obtained from stockpiled soil generated during the creation of ingress and egress ramps as well as sampling platforms near the lagoon excavation. The locations that the backfill material came from are not known to be impacted as they were outside of the contaminated section of the lagoon. The soil was visually inspected by field personnel prior to use as backfill and was determined to be uncontaminated. No specific samples of the backfill material were taken other than the outlying samples indicating where the lagoon contamination ended.

If you have any questions, or if we can be of further service to you, please do not hesitate to call me at (505) 722-0217.

Sincerely,

Western Refining Company

RE: REVISED RAILROAD RACK LAGOON OVERFLOW DITCH AND FAN-OUT AREA,
SWMU No. 8 SUBSURFACE INVESTIGATION FINAL REPORT
WESTERN REFINING COMPANY SOUTHWEST, INC., GALLUP REFINERY
EPA ID # NMD00033211
HWB-WRG-10-002"

Dear Mr. Bearzi:

Western Refining Company Southwest Inc. (Western) is submitting this cover letter and the attached report as required by the New Mexico Environment Department (NMED). These documents demonstrate that the soil in the vicinity of Western's Railroad Rack Lagoon Overflow Ditch and Fan-Out Area with Diesel Range Organic (DRO) concentrations above NMED's cleanup standard of 890 mg/kg has been excavated. Western submitted the *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8, Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery, EPA ID # NMD00033221, HWB-WRG-10-002* (Report) on January 6, 2010. NMED issued a *Notice of Disapproval* (NOD) to the Report on May 12, 2010. The NOD contained nine comments which NMED requested to have addressed prior to approving the report. Western submitted a response to NMED's comments on June 23, 2010 explaining how Western planned to address each of NMED's comments in a revised final Report.

NMED submitted a letter titled, *Direction for Additional Soil Confirmation Sample Collection and Approval of Extension Request, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery, EPA ID # NMD00033221, HWB-WRG-10-002* (Direction for Additional Confirmation Sampling), on July 28, 2010. In this letter, NMED proposed that 11 additional confirmation samples be collected to demonstrate that the DRO contaminated soil had been removed. Western agreed to collect the 11 additional samples in a letter dated August 9, 2010. In this correspondence, Western also assumed that NMED's remaining NOD comments were adequately addressed in Western's June 23, 2010 correspondence. This assumption was verified during a phone conversation between Western (Ed Riege), NMED (Kristen Van Horn and Dave Cobrain), and Trihydro (Grant Price) on September 1, 2010.

NMED's NOD comments are listed below, followed by Western's June 23, 2010 responses. Previously proposed/approved report revisions are shown below in green text. Report revisions determined to be necessary after the original June 23, 2010 NOD responses are shown in blue text. NMED Comment 1 has been divided into subcomments so that each topic could be addressed separately.

NMED Comment 1

NMED's December 11, 2009 *Approval with Modifications*, required the Permittee to define the vertical and horizontal extent of contamination at the overflow and fan-out area. From the Report, it is not clear that the Permittee completed the task to define the vertical extent of contamination. Table 1 (DRO Analytical Data Summary) lists results that are above the Total Petroleum Hydrocarbon (TPH) Diesel Range Organics (DRO) cleanup level of 890 mg/kg.

Response to Comment 1

Table 1 of the Report lists all DRO data associated with the B-8 and B-9 excavations. These two locations were determined to be the only areas of concern based on the October 2006 investigation. In order to define the vertical and horizontal extent of contamination, contaminated soil must be identified. Therefore, Western deemed it appropriate to show the results of the contaminated soil on Table 1 and Figure 5. When DRO exceedances were discovered, the excavation was expanded to remove the DRO contaminated soil and additional confirmation samples were collected. Table 2 (a subset of Table 1) has been created to show the confirmation samples collected at the base and sidewalls of the excavation. These samples have DRO concentrations below the cleanup level of 890 mg/kg, thus delineating the vertical and horizontal extent of contamination. Table 2 is included as an attachment to this correspondence and, upon NMED approval, will be included in a revised version of the Report. The results of the additional confirmation samples collected on August 23 and 25, 2010 have been added to Tables 1 and 2 which are included in the revised Report.

NMED Comment 1 cont'd

Figure 5 (Railroad Rack Lagoon Overflow Ditch B-8 Excavation Areas and DRO Results) presents sample results and areas that were excavated, but it does not appear that confirmation samples were collected at the bottom of the excavation. The excavation bottom samples were required by NMED's March 14, 2009 letter *Approval with Direction* which stated "[i]f the excavation does not exceed three feet below ground surface (bgs), the Permittee may collect confirmation samples from the bottom of the excavations only. If the excavation exceeds three feet bgs, then confirmation samples must be collected from all sidewalls of the excavations in addition to from the base of the excavations." The Permittee did not follow this directive, for example, in Area 3, which was excavated to seven feet; confirmation samples were not collected from the base of this excavation.

Response to Comment 1 cont'd

Sample CS-14, located on the northwest corner of Area 3, was collected at 7 ft bgs from the edge of Areas 3 and 4. Thus, it can be considered a base confirmation sample for Area 3 and a sidewall confirmation sample for Area 4.

Sample CS-22 was collected approximately 2 feet north of Area 3. CS-22 was collected at 7 ft bgs to vertically delineate DRO contamination discovered in samples CS-19, CS-20, and CS-21

(3 ft bgs, 3.5 ft bgs, and 3.5 ft bgs, respectively). These samples, in part, necessitated extending the depth of the excavation in Area 3 (from 3 ft bgs to 7 ft bgs). Sample CS-22 was initially planned to be a base confirmation sample in Area 3; there are no DRO exceedances in the immediate vicinity of this sample location necessitating excavation deeper than 7 ft bgs. However, due to the nature of excavating with a backhoe (i.e. the precision and accuracy of the backhoe) and the fact that the areas were measured after the excavation had been completed, the portion of Area 3 including CS-22 was excavated to 13 ft bgs. Western believes that CS-22 may still be used to demonstrate vertical delineation (as a base sample) at Area 3 at a depth of 7 ft bgs even though it is technically located approximately 2 feet north of Area 3.

NMED Comment 1 cont'd

In Area 4, which was excavated to 13 feet, the Permittee collected six samples around the perimeter of the excavation at a depth of 13 feet and only three samples were collected from the base of the excavation.

Response to Comment 1 cont'd

Western is unclear as to NMED's comment that six samples were collected from around the perimeter of the excavation at a depth of 13 feet. As presented on Figure 5 and Table 1, three samples were collected from the base at perimeter of the 13 foot excavation (A-1, A-2, and A-3) and three internal base samples were collected from within the 13 foot excavation (CS-1, CS-16, and "B"). Thus, Western believes a total of six base confirmation samples were collected from Area 4. Further, four sidewall samples were collected from the 13-foot excavation. These sidewall samples include B-8 Center (5 feet), E (5 feet), K (5 feet), and M (5 feet).

To help clarify this issue, Western has created Figure 7 to illustrate base and sidewall confirmation samples for each area. The sidewall samples are shown as orange and base samples are shown as magenta. There are a few samples that can be considered both base and sidewall samples. For example, CS-14 is collected at 7 ft bgs on the corner of Area 3 and Area 4. In respect to Area 3, this is a base sample. In respect to Area 4, it is a sidewall sample. These "base/sidewall" samples are illustrated on Figure 7 in cyan. Figure 7 is included as an attachment to this correspondence and, pending NMED approval, will be included in a revised version of the Report. The results and locations of the additional confirmation samples collected on August 23 and 25, 2010 have been added to Figures 5 and 7 which are included in the revised Report.

NMED Comment 1 cont'd

At one point (A (B8-NEW-SE)) there is an increase in DRO concentration with depth and apparently no sample collected to demonstrate that the DRO-contaminated soil was removed.

Response to Comment 1 cont'd

At the time that additional delineation samples were being collected in the vicinity of A (B8-NEW-SE) (henceforth referred to as "A") to help determine the vertical extent of DRO contamination, a hollow stem auger drill rig was being used to collect soil samples. Due to the open excavation immediately adjacent to "A", deeper samples were not able to be safely collected at this exact location. Instead, deeper samples were collected at B (B8-NEW-SE-S1) (henceforth referred to as "B") which also showed DRO exceedances at depths as deep as 7 ft bgs. The "B" sample location is approximately 2 to 3 feet east of "A" and samples collected from 13 ft bgs, 18

ft bgs, and 23 ft bgs were each non-detect for DRO, thus verifying that the 13 ft bgs excavation was sufficient to remove DRO-contaminated soil.

NMED Comment 1 cont'd

In order to determine whether or not the removal of all soils containing concentrations of DRO above 890 mg/kg from the fan-out area was completed, the Permittee needed to collect samples from the base and sidewalls of the excavation. Therefore, confirmation samples must be collected at the excavation bottom and from the sidewalls using a systematic sampling pattern and samples must also be collected from areas of visible staining, elevated moisture levels, and contaminated zones identified by field-screening and beneath areas with detected residual contamination.

Response to Comment 1 cont'd

In the March 14, 2009 letter *Approval with Direction*, NMED had originally requested that 13 confirmation samples be collected for the original excavation area. However, because CS-2, CS-4, and CS-8 exceeded the DRO cleanup level, the excavation was expanded and 33 confirmation samples were collected (26 base, 4 sidewall, 3 base/sidewall – see Figure 7).

Western collected confirmation samples in accordance with the locations that NMED approved in the “Approval With Direction, Railroad Rack Lagoon Fan-Out Area Excavation Work Plan, Western Refining Southwest, Inc., Gallup Refinery, EPA ID #: NMD000333211, HWB-GRCC-07-002.” When the size of the excavation was increased due to DRO exceedances, the same methodology was used to collect additional confirmation samples. An example of this methodology is shown using samples CS-19, CS-20, CS-21 and CS-22. Samples CS-19, CS-20, and CS-21 were above the DRO cleanup level at 3 or 3.5 ft bgs. Thus, the excavation was extended to 7 ft bgs in this area and CS-22 (horizontally located in the middle of CS-19, CS-20, and CS-21) was collected to vertically delineate DRO contamination.

As mentioned in section 4.3.3 of the Report, due to limited correlation shown between field screening data and confirmation sampling results, NMED permitted Western to proceed with the excavation utilizing visual observations and confirmation sampling results in lieu of field screening. When areas exhibiting visual contamination were identified, the size of the excavation was expanded and confirmation samples were collected. This was the case for CS-19 and CS-20. When the CS-19 and CS-20 samples were being collected, visible staining was observed. Thus, once the laboratory results were received, it was decided to excavate the area to 7 feet. This was the depth at which the staining was visibly removed.

NMED Comment 1 cont'd

Until the Permittee defines the extent of the contamination, NMED cannot determine if further remediation is necessary. The Permittee must conduct additional confirmation sampling and, if necessary, conduct additional excavation activities if the confirmation samples contain DRO concentrations greater than the acceptable cleanup level.

Response to Comment 1 cont'd

As mentioned in Section 7.0 of the Report, the B8 DRO exceedances discovered during the investigation/excavation are surrounded by a total of 67 soil samples showing DRO

concentrations less than the cleanup standard. Western believes these 67 soil samples define the extent of the DRO contamination and no additional confirmation sampling is necessary. However, per NMED's Direction for Additional Confirmation Sampling, 11 additional confirmation samples were collected on August 23 and 25, 2010. The additional sampling is discussed in Section 3.2 of the Report. Additional sample results and locations have been added to Tables 1 and 2 and Figures 5 and 7. A total of 784 cubic yards of DRO-contaminated soil encompassed by these 67 samples has been excavated. Therefore, Western believes no further excavation activities are necessary. This conclusion was supported by the additional 11 confirmation samples as discussed in Section 3.2 of the Report.

NMED Comment 1 cont'd

In the revised Report, the Permittee must submit a figure depicting the locations of the final confirmation sample locations, depths the samples were taken, and the analytical results. The Permittee must submit proposed confirmation sample locations for NMED approval no less than 30 days before confirmation sampling activities begin.

Response to Comment 1 cont'd

Figure 5 of the Report shows all sample locations, depths, and analytical results. Figure 7 and Table 2 (provided as attachments to this correspondence) have been created to show only the final confirmation sample locations. The revised Report will be updated to include Figure 7 and Table 2.

Note that Figure 7 and Table 2 only show confirmation sample results of those samples that were collected from the base or sidewall of the final excavation. Numerous other samples (for example, CS-24 and CS-18) were also necessary for delineating the DRO contaminated area. However, since these samples were not collected from the base or sidewall of the final excavation, they are not included on Figure 7 or Table 2. Figure 7 and Table 2 will be incorporated into the revised Report.

NMED Comment 2

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states "[c]onfirmation sample locations were strategically located to supplement the existing DRO data." The Permittee must include more detail regarding the confirmation sampling (i.e., provide the rationale for the "strategic" location of the confirmation samples). The Permittee must revise the Report to include specific details regarding the confirmation sampling locations and the logic behind the selection of the sampling locations.

Response to Comment 2

Thirteen original confirmation sample locations and depths were approved by NMED in the "Approval With Direction, Railroad Rack Lagoon Fan-Out Area Excavation Work Plan, Western Refining Southwest, Inc., Gallup Refinery, EPA ID #: NMD000333211, HWB-GRCC-07-002." These locations were selected because limited DRO data existed in these areas. These confirmation samples are identified as CS-1 through CS-13. If a confirmation sample showed a DRO exceedance, the excavation was expanded. As the excavation was expanded, additional confirmation samples were collected to verify that the soil remaining in place was below the

DRO cleanup standard. An example of this logic is provided in the response to Comment 1 (CS-19, CS-20, CS-21, and CS-22).

NMED Comment 3

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states “[d]ue to confirmation sample DRO exceedances, the size of the excavation; as proposed in the 2008 Excavation Work Plan, was increased ... Excavation activities continued through October 2009 due to additional confirmation sample exceedances and visually impacted soil.” The Permittee must revise the Report to include additional detail regarding the excavation. For example, the Permittee must state, or include a figure with, the locations where the exceedances were found (e.g., sample location, depth, cardinal direction), discuss the amount of soil removed during each of the excavations, and describe confirmation sampling.

Response to Comment 3

Per the 2008 Excavation Work Plan, confirmation samples CS-1 through CS-13 were collected from the original excavation. The results of these samples, as well as the results of all samples associated with the excavation, are shown on Table 1 and Figure 5 of the Report. Of the original 13 confirmation samples, CS-2, CS-4, and CS-8 exceeded the DRO cleanup standard. Figure 4 shows the proposed excavation area versus the actual excavation area. As shown on Figure 4, the original confirmation sample exceedances prompted the excavation to be expanded generally to the west and southwest. However, each exceedance identified during delineation and excavation activities prompted additional investigation/excavation. As shown on Table 1, 28 exceedances were identified in the B-8 Excavation. Western deemed it more appropriate to illustrate these exceedances on a figure (Figure 5) rather than attempt to describe each of them in the text of the report.

NMED also requested that Western provide the amount of soil removed during each of the excavations. Western considers this to be a single excavation that was continuously expanded until the DRO contaminated soil was delineated and removed. Intermediate volumes were not required as part of the 2008 Excavation Work Plan, thus this information was not recorded or calculated. However, the final total volume is presented in Section 7.0 of the Report.

Confirmation soil sampling procedures are discussed in Section 4.3.2.2 and 4.3.1.2 of the Report.

NMED Comment 4

In Section 3.2 (Excavation Activities), page 3-2 and 3-3, the Permittee states “Test Pit B-8 confirmation sample locations and results are illustrated in Figure 5. Area 1 was excavated to depth of 3 feet below ground surface (ft bgs), and excavation activities in this area were overseen by Trihydro. Area 2 was excavated to a depth of 5 ft bgs by Gallup personnel. Area 3 and 4 excavations were overseen by a combination of Trihydro and Gallup personnel and extended to 7 and 13 ft bgs.” The Permittee must revise the Report to discuss the basis for excavation to the various depths (e.g., the confirmation sample detections that indicated the need for additional soil removal). The Permittee must revise Figure 5 or provide an additional figure to show the final confirmation sample locations, see Comment 1.

Response to Comment 4

As presented in the Report, each area was excavated until the outermost samples (both horizontal and vertical) were below the DRO cleanup standard of 890 mg/kg. For example, an exceedance of DRO was discovered at 9 ft bgs at sample location "A." Therefore, this area was excavated to 13 ft bgs which was shown to be below the cleanup standard at sample location "B." The final confirmation samples prompting cessation of the excavation are illustrated on Figure 7 and Table 2. This Figure and Table are provided as attachments to this document and, pending NMED approval, will be provided in the revised Report. Figure 7 and Table 2 have been added to the report.

NMED Comment 5

In Section 4.3.1.1 (Delineation Sample Locations), page 4-2, paragraph 2, the Permittee states "[t]he sampling locations in these three delineation sampling events (May, August, and December 2007) were determined based on exceedances identified during the preceding sampling events. These locations are illustrated on Figures 5 and 6." The Permittee must list these sampling locations by name in the text, so that the locations can be identified in the figures. Additionally, Figure 5 appears to illustrate the locations of multiple sampling events beyond the three delineation events mentioned above. The Permittee must revise the Report to refer to specific sampling locations, instead of referring to the locations generally.

Response to Comment 5

A total of 101 samples were collected throughout the investigation/excavation. Western believes that attempting to discuss each individual sample result, whether or not the result prompted additional excavation, and what direction the excavation was expanded due to the result of the sample would cause more confusion than clarification. Instead, Western provided this information on Figure 5 where the information can be visualized. Each exceedance identified during delineation and excavation activities prompted additional investigation/excavation. The excavation was expanded until data showed that the remaining outermost samples (both horizontally and vertically) were below the cleanup standard.

As mentioned in NMED's comment, the text of the Report refers to three delineation events (May, August, and November 2007). These delineation events were used to determine the initially proposed excavation area presented in the 2008 Excavation Work Plan, dated September 17, 2008. Western considers subsequent field activities (excavation and confirmation sampling) as one, continuous field event, which is why multiple excavation "events" are not discussed in the text. The data collected from excavation and confirmation sampling is presented on Table 1 and Figure 5 in addition to the data collected from the three delineation events, for completeness. Sample IDs, the date which the sample was collected, the depth at which the sample was collected, and whether or not the sample exceeded the DRO cleanup standards are shown on Table 1. Sample locations, depths, and results are shown Figures 5 and 6. The sample dates shown on Table 1 may be used to determine with which event each sample is associated.

NMED Comment 6

In Section 4.3.2.1 (Confirmation Sample Locations), page 4-4, paragraph 1, the Permittee states "[a] total of ten sidewall and base confirmation sample locations were proposed in the 2008 Excavation Work Plan.

Three additional locations were added at the suggestion of NMED in the December 11, 2008 Approval with Direction letter provided as Appendix F. These 13 locations were strategically located in areas where DRO delineation data was limited in an attempt to fill potential data gaps. Of the 13 approved confirmation sampling locations, 3 exceeded the DRO cleanup standard prompting expansion of the excavation.” The Permittee must revise the Report to be specific regarding the sample location names (e.g., instead of stating, “of the 13 approved sampling locations, 3 exceeded,” list the specific location designations).

Response to Comment 6

As shown in Table 1 of the 2008 Excavation Work Plan, the original proposed confirmation sampling locations are designated CS-1 through CS-10. Per NMED’s conditional approval, CS-11 through CS-13 were added. As shown in Table 1 and Figure 5 of the Report, CS-2, CS-4, and CS-8 exceeded the DRO cleanup standard. The revised Report will specify CS-2, CS-4, and CS-8 as the three original confirmation sample locations that exceeded the cleanup level. Section 4.3.2.1 has been revised accordingly.

NMED Comment 7

In Section 4.4 (Investigation Derived Waste), page 4-5, the Permittee states “[e]xcavated soils and soil cuttings produced during the sampling events have been transported to Gallup’s Land Farm as permitted by OCD.” The Permittee must revise the Report to describe the estimated volume of soil cuttings and excavated soil that were disposed of at the Land Farm.

Response to Comment 7

As stated in Section 7.0 of the Report, approximately 784 cubic yards of soil were excavated from B-8. Dimensions for the B-9 excavation were also included in the Report, however the volume of soil was not. Approximately 3 cubic yards of soil were excavated from B-9. The revised Report will include the total cubic yards of soil excavated from B-9. Section 7.0 has been revised accordingly.

NMED Comment 8

In Section 6.1 (Test Pit B-9), the Permittee states “samples collected from each corner of the excavation at depths of 3 ft bgs and the center of the excavation at a depth of 5 ft bgs showed DRO concentrations below the clean up standard.” The sample points are illustrated in Figure 6 (Railroad Rack Lagoon Overflow Ditch B-9 Final Excavation Area and Sample Results); the Permittee excavated the ditch to 5 feet, but in the figure it is not apparent that the 3 ft samples are sidewall samples. The Permittee must revise the Report and Figures to differentiate between sidewall and bottom confirmation samples (e.g., use different symbols or colors on the figures, provide additional figures or in a table cross-referenced in the figure key).

Response to Comment 8

If a sample is collected at the boundary of an area at a depth less than the total depth of the area, it is considered a sidewall sample. If a sample is collected at a depth equal to the total depth of a specific area, it is considered a base sample.

The revised Report will be updated to show base and sidewall samples as magenta and orange, respectively. For the B-9 Excavation, Figure 6 will be updated according to this color scheme. Figure 6 has been revised accordingly.

Due to the complexity of Figure 5, Figure 7 has been created for the B-8 Excavation to show only the final confirmation samples. The above mentioned orange and magenta color scheme is used to differentiate between base and sidewall samples. There are a few samples that can be considered both base and sidewall samples. For example, CS-14 is collected at 7 ft bgs on the corner of Area 3 and Area 4. In respect to Area 3, this is a base sample. In respect to Area 4, it is a sidewall sample. These "base/sidewall" samples are illustrated on Figure 7 in cyan. Figure 7 has been added to the report.

NMED Comment 9

In Section 6.2 (Test Pit B-8), the Permittee states "As illustrated on Figure 5, between delineation and confirmation sampling activities, a total of 67 soil samples showing DRO concentrations below the cleanup standard have been excavated from the vicinity of Test Pit B-8. A summary of the analytical data is provided as Table 1." Figure 5 and Table 1 appear to show either residual contamination, or that the Permittee did not collect confirmation samples from the base of the excavation. See Comment 1 regarding Figure 5, Table 1 and additional confirmation sampling requirements.

Response to Comment 9

Figure 5 and Table 1 show all delineation and confirmation sampling data, regardless of whether the data exceeds the DRO cleanup standard or not. The outermost (horizontally and vertically) data do not exceed the cleanup standard. Western deemed it appropriate to include the exceedances so that NMED could see that the DRO contamination has been delineated. Figure 7 and Table 2 have been created to show that confirmation samples below the cleanup standard surround the sidewalls and base of the excavation. Figure 7 and Table 2 have been updated to include the locations and sample results of the additional 11 confirmation samples.

NMED FINAL COMMENT

The Permittee must address all comments contained in this NOD and submit a revised Work Plan to NMED and OCD on or before July 20, 2010. The revised Report must be accompanied by a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. In addition, the Permittees must submit a redline-strikeout version that includes all changes and edits to the Report (electronic copy) with the response to this NOD.

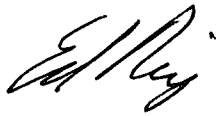

Final Comment Response

Western believes that the additional explanation provided in this response, along with Figure 7 and Table 2, show that the Fan-out Area DRO contamination has been delineated and excavated. Thus, Western hopes that a revised Work Plan will not be necessary. Upon NMED's approval of these responses, Western will provide a letter detailing the revisions to the Report and cross-referencing NMED's numbered comments. Western considers this correspondence to be the letter detailing revisions to the Report and cross-referencing NMED's numbered comments. Western will also provide an electronic redline-strikeout version that includes all changes and

edits to the Report. The redline-strikeout version that includes all changes and edits to the report is provided as an attachment to this letter.

Western believes that this letter, along with the attached, revised Report, demonstrate that the soil in the vicinity of Western's Railroad Rack Lagoon Overflow Ditch and Fan-Out Area with DRO concentrations above NMED's cleanup standard of 890 mg/kg has been excavated. Upon NMED approval of the attached revised Report, Western will backfill the B-8 excavation with clean fill material. If you have any questions, or if we can be of further service to you, please do not hesitate to call me at (505) 722-0217.

Sincerely,
Western Refining Company

Ed Riege
Environmental Manager

EXECUTIVE SUMMARY

In June 2006, the New Mexico Environment Department (NMED) requested that the Gallup Refinery (Gallup), located near Gallup, New Mexico, investigate the presence of residual contamination in the Railroad Rack Lagoon Overflow Ditch and Fan-out Area. These two areas are considered to be part of Solid Waste Management Unit No. 8 (SWMU No. 8). A soil sampling work plan was submitted to NMED on August 29, 2006. After minor modifications to the work plan at NMED's request, a subsurface soil investigation of the Railroad Rack Lagoon Overflow Ditch and Fan-out Area was conducted in October 2006.

This investigation resulted in the discovery of two locations, Test Pits B-8 and B-9, which showed total petroleum hydrocarbon (TPH) diesel range organic (DRO) concentrations exceeding NMED's cleanup standard of 890 mg/kg. Further sampling was required to delineate the DRO contamination associated with these test pits. Three subsequent sampling events were conducted in May, August, and December 2007 in order to delineate the extent of the DRO contamination and approximate an estimated volume of material to be excavated.

After delineation activities were believed to be complete, plans for excavating and transporting the DRO contaminated soil were made. Excavation and confirmation sampling events were conducted from March 2009 through August 2010. These events continued until confirmation samples verified that soil with DRO concentrations exceeding the cleanup standard had been removed. Excavated soils met the Oil Conservation District's (OCD) acceptance criteria and were transported to Gallup's Northeast Land Farm.

This report describes the delineation, sampling, and excavation activities that have occurred since the October 2006 subsurface investigation. Gallup believes that the information presented in this report demonstrates that the soil in the Rail Road Rack Lagoon Overflow Ditch and Fan-out Area with DRO concentrations above the cleanup standard has been excavated. The excavations associated with Test Pits B-8 and B-9 currently remain open and will be promptly backfilled with clean fill material pending NMED approval of this report.

1.0 INTRODUCTION

Western Refining (formerly known as Giant Industries, Arizona Inc.) requested that Trihydro Corporation (Trihydro) conduct a subsurface investigation at the Gallup Refinery (Gallup) near Gallup, New Mexico to characterize soil in the Railroad Rack Lagoon Overflow Ditch and Fan-out Area (Overflow Ditch and Fan-out Area) which are located within Solid Waste Management Unit No. 8 (SWMU No. 8). SWMU No. 8 is located on Gallup property northeast of the main refining process area. A topographic map of Gallup that shows the relative location of the Overflow Ditch and Fan-out Area is included as Figure 1. Figure 2 shows SWMU No. 8 and surrounding well locations as required by the New Mexico Environment Department (NMED). Trihydro's initial subsurface investigation was conducted in October 2006 (October 2006 Subsurface Investigation). As a result of this investigation and subsequent NMED correspondences, soil with diesel range organics (DRO) concentrations exceeding 890 mg/kg have been excavated from portions of the Overflow Ditch and Fan-out Area. This report is being submitted to NMED to summarize the subsurface investigation and remedial activities conducted at SWMU No. 8.

2.0 BACKGROUND

The Overflow Ditch and Fan-out Area were used to manage overflow when the Railroad Rack Lagoon was filled beyond capacity. The Railroad Rack Lagoon has not been used since the mid-1980's. Figure 3 shows the dimensions and relative location of the Overflow Ditch and Fan-out Area. Both of these areas are considered to be part of SWMU No. 8. The Fan-out area is generally surrounded by earthen berms approximately 2-3 feet (ft) high. The Railroad Rack Lagoon, Overflow Ditch, and Fan-out area were sampled during the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) in 1992. During this investigation, soil samples from these areas were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and total metals. The RFI concluded that VOCs/SVOCs were at minimal levels, and inorganic levels were below background contamination levels with the exception of chromium. However, chromium levels were below the RCRA Corrective Action levels, thus no remediation was required.

The October 2006 Subsurface Investigation was conducted in response to a letter that Gallup received from NMED, dated June 29, 2006. In this correspondence, comment # 26 requested information regarding the presence of residual contamination in the Overflow Ditch and Fan-out Area locations. A soil sampling work plan was submitted to NMED on August 29, 2006. Two sample location changes were requested by NMED in a letter titled *Approval with Modifications, Work Plan For Investigation of the Overflow Ditch and Fan-Out Area of Railroad Rack Lagoon, SWMU No. 8*, dated September 19, 2006. Gallup and Trihydro modified the sampling locations accordingly. The remainder of the work plan was approved by the NMED.

The results of this investigation were reported in the *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU 8 Subsurface Investigation* report (October 2006 Subsurface Investigation Report), dated February 8, 2007. Based on the findings of the October 2006 Subsurface Investigation, two areas were identified in the Overflow Ditch and Fan-out Area where NMED's DRO total petroleum hydrocarbon (TPH) guideline of 890 mg/kg (cleanup standard) was exceeded. As described in the October 2006 Subsurface Investigation Report, these areas are associated with Test Pits B-8 and B-9. Figure 3 shows the locations of these test pits. Several field events have been conducted since the initial subsurface investigation to delineate the extent of the DRO contamination, excavate DRO contaminated soil, and collect confirmation samples to demonstrate that soil with DRO concentrations exceeding the cleanup standard has been removed. This report describes the field activities conducted after the October 2006 Subsurface Investigation Report and presents the analytical data that demonstrates that DRO contaminated soil associated with Test Pits B-8 and B-9 has been removed.

3.0 SCOPE OF SERVICES

Based on the results of the October 2006 Subsurface Investigation, NMED required that Gallup develop and implement a plan for determining the extent of and removing DRO contaminated soil associated with Test Pits B-8 and B-9.

Gallup subsequently requested Trihydro's assistance in delineating and excavating the DRO contamination associated with these locations. The remainder of this section details the activities that were implemented to achieve these project objectives.

3.1 DRO DELINEATION ACTIVITIES

May 2007

In May 2007, Test Pits B-8 and B-9 were increased in size, both horizontally and vertically, in an attempt to excavate DRO contaminated soil above the cleanup standard. Confirmation samples were collected from both of the newly expanded excavations. The updated test pit logs for the expanded test pits are included as Appendix A and sample forms are included in Appendix B.

The soil sample results from the excavation associated with Test Pit B-9 were below the DRO cleanup standard. Excavated soils have been transported to Gallup's Northeast Oil Conservation District (OCD) Land Farm. Gallup contacted OCD and verified that the excavated soil was permitted to be accepted by the Land Farm. Based on this data, DRO contaminated soil in the vicinity of Test Pit B-9 has been excavated.

The confirmation soil sample results from Test Pit B-8 remained higher than the cleanup standard for DRO (890 mg/kg). As a result, Gallup requested that Trihydro conduct another investigation to delineate the DRO contamination associated with Test Pit B-8. This investigation was conducted in August 2007.

August 2007

The objective of the August 2007 sampling event was to delineate the DRO contaminated soil associated with Test Pit B-8. Soil samples were collected during the week of August 20, 2007 and were located to accurately delineate DRO contamination and minimize the amount of soil that would potentially require excavation. Several of the August 2007 soil samples exceeded the DRO cleanup standard prompting additional field events. The sample forms from the August 2007 event are included in Appendix B.

December 2007

The objective of this field event was to further delineate DRO contamination associated with Test Pit B-8. The spacing and depths of sampling locations were increased during the December 2007 event to assist in efficiently delineating the extent of DRO contamination. Samples were collected in a radial pattern 20 feet away from the outermost DRO exceedances discovered during the August 2007 event using a hollow-stem auger drill rig. Borehole logs from this sampling event are provided as Appendix C. Sample forms were not completed for these locations because all relevant sampling information is recorded on the borehole logs. Results from samples collected during the December 2007 event showed DRO concentrations below the cleanup standard. Accordingly, preparations for excavation began. The analytical data reports along with data validation reports for DRO delineation activities are included in Appendix D. Analytical data is summarized in Table 1.

3.2 EXCAVATION ACTIVITIES

Following the DRO delineation activities, Gallup requested Trihydro's assistance to develop and implement an excavation plan to remove soil exceeding the DRO cleanup standard in the vicinity of Test Pit B-8. The remainder of this section summarizes the development and implementation of this plan.

A letter titled *Railroad Rack Lagoon Fan-out Area Excavation Work Plan* was submitted to NMED for approval on May 2, 2008. NMED commented on this work plan in a letter dated July 22, 2008 which is provided as Appendix E. The work plan was revised to address NMED's concerns and resubmitted in report format on September 17, 2008. This document, titled *Railroad Rack Overflow Ditch and Fan-Out Area Soil Investigation Work Plan* (2008 Excavation Work Plan), was approved with direction in a letter from NMED dated December 11, 2008 which is included as Appendix F. Excavation and confirmation sampling activities commenced in March 2009 in accordance with these documents.

Confirmation sample locations were strategically located to supplement existing DRO data. Confirmation samples were sent to Hall Environmental located in Albuquerque, NM for DRO analysis. Due to confirmation sample DRO exceedances, the size of the excavation, as proposed in the 2008 Excavation Work Plan, was increased. A comparison between the size of the excavation as proposed in the 2008 Excavation Work Plan and the actual size of the excavation area is shown on Figure 4. Excavation activities continued through October 2009 due to additional confirmation sample exceedances and visually impacted soil. During this timeframe, a total of 24 confirmation samples showing DRO concentrations below the cleanup standard were collected. Figure 5 shows sample locations and results from

throughout the investigation, including the delineation and confirmation sampling events. Area 1 was excavated to depth of 3 feet below ground surface (ft bgs), and excavation activities in this area were overseen by Trihydro. Area 2 was excavated to a depth of 5 ft bgs by Gallup personnel. Area 3 and 4 excavations were overseen by a combination of Trihydro and Gallup personnel and extend to 7 and 13 ft bgs, respectively.

Upon completion of the October 2009 excavating and confirmation sampling, the original *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company, Gallup Refinery, Gallup, New Mexico*, dated January 6, 2010, was submitted to NMED. NMED issued a *Notice of Disapproval, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery, EPA ID # NMD000333211, HWB-WRG-10-002* (NOD), on May 12, 2010. This correspondence is provided as Appendix G. The NOD contained 9 comments that NMED requested to have addressed prior to approving the Report. Western submitted a response to NMED's comments on June 23, 2010 explaining how Western planned to address each the comments in a revised final report. This correspondence, titled *Re: NMED's Notice of Disapproval, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery, EPA ID # NMD000333211, HWB-WRG-10-002* is provided as Appendix H. Western also had to request an extension for the submittal of the revised Report while waiting for NMED to respond to the June 23, 2010 correspondence. The extension request is included as Appendix I. In a correspondence titled, *Direction for Additional Soil Confirmation Sample Collection and Approval of Extension Request, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery, EPA ID # NMD000333211, HWB-WRG-10-002*, dated July 28, 2010, NMED expressed dissatisfaction with the confirmation sampling density and requested that Western collect 11 additional confirmation samples at NMED-proposed locations. This correspondence is provided as Appendix J. Western agreed to collect the additional 11 confirmation samples in a correspondence dated August 9, 2010 which is provided as Appendix K. These samples were collected on August 23 and 25, 2010. Sample results for each of the 11 final confirmation samples were below the NMED cleanup standard of 890 mg/kg. Therefore, no additional excavation was required. This report has been revised to include the results of the additional confirmation samples.

4.0 FIELD INVESTIGATION METHODOLOGY

Excavation and confirmation sampling activities began in March 2009 and continued through August 2010. The surface conditions, subsurface conditions, investigation methodologies, and the disposal of investigation derived waste are described in the following subsections.

4.1 SURFACE CONDITIONS

The surface topography of the investigation area is relatively flat with the Fan-out area being generally surrounded by earthen berms approximately 2-3 ft high. Vegetation at the site is sparse and consists mainly of sagebrush and natural grasses. The Railroad Rack Lagoon and Fan-out Areas are located on land owned and controlled by Gallup. The industrial property boundaries are shown on Figure 1.

4.2 SUBSURFACE CONDITIONS

As shown in the test pit and borehole logs, lithology in the excavations and boreholes installed since the October 2006 Subsurface Investigation did not differ significantly from the lithology described in the October 2006 Subsurface Investigation Report. Lithology was generally composed of silts and clays with the higher percentages of silts at shallower depths and higher percentages of clays at deeper depths. A moist to wet 0.75-inch layer of sand was noted at 22 ft bgs at Borehole B8-NEW-SE-S1; however, groundwater was not encountered during any of the field events. Test pit and borehole logs are presented as Appendices A and C, respectively.

A low density, black, asphalt-like material was identified during the October 2006 Subsurface Investigation and described in the October 2006 Subsurface Investigation Report. This material was noted on the surface around and in Test Pits B-1 and B-6 during the October 2006 Subsurface Investigation but was not seen in the subsequent events. However, a trace of black staining following the fractures in the silt and clay was noted in both the B-8 and B-9 excavations. Sample B8-EXTRA was collected from the southeast side of the original B-8 excavation at a depth of 2 ft bgs to characterize the stained soil. Laboratory analysis showed DRO concentrations of 140 mg/kg, which is below the DRO cleanup standard of 890 mg/kg.

Potentially impacted soil exhibiting dark staining and a hydrocarbon odor was identified during June 2009 by Gallup personnel in the western portion of Area 4 (see Figure 5). Visually impacted soil was removed and confirmation

samples CS-29, CS-30, CS-31, A-1, A-2, and A-3 were collected by Gallup personnel to verify that the DRO impacted soil had been removed. These samples all showed DRO concentrations below the cleanup standard of 890 mg/kg.

4.3 SOIL INVESTIGATION METHODOLOGY

Investigation methodologies varied for DRO delineation and excavation/confirmation sampling activities. Section 4.3.1 describes methodologies used for DRO contamination delineation and Section 4.3.2 details the excavation and confirmation sampling methodologies.

4.3.1 DELINEATION INVESTIGATION METHODOLOGY

Since the October 2006 Subsurface Investigation Report was submitted, three field events were conducted in May, August, and December 2007 to help delineate the extent of DRO contamination. A summary of these events is provided in Section 3.1. The investigation methodologies implemented during these three events are discussed below.

4.3.1.1 DELINEATION SAMPLE LOCATIONS

The original ten October 2006 Subsurface Investigation test pit/sample locations were selected based on the sample locations from the RFI in 1992. These locations were submitted to the NMED for approval in the soil sampling work plan submitted on August 29, 2006. Two sample locations were modified at the NMED's request. The sample locations were located in the field by Trihydro using the Overflow Ditch and the berms of the Fan-out Area as measurement reference points. The locations were staked and labeled with the applicable sample identification. Photographs of the staked locations are presented in the October 2006 Subsurface Investigation Report. Figure 3 illustrates the approximately measured dimensions of the Overflow Ditch, the Fan-out Area, and the test pit/sample locations.

The sampling locations in these three delineation sampling events (May, August, and December 2007) were determined based on the exceedances identified during the preceding sampling events. These locations are illustrated on Figures 5 and 6. Sample locations were located in the field and staked by Trihydro personnel. The stakes from each of the previous sampling events remained in the ground (as the excavation allowed) and were used as measurement reference points.

4.3.1.2 DELINEATION SOIL SAMPLING PROCEDURES

Information pertaining to soil sample collection including but not limited to, the sampler, the date, time, and depth that the sample was collected, and whether or not duplicate samples were collected is included on the soil sample forms and borehole logs included as Appendices B and C, respectively. Soil samples were transferred directly from the decontaminated sampling device to clean 4-ounce jars provided by the laboratory. The sample containers were completely filled to minimize headspace (by tamping during filling) and immediately sealed. Sample containers were immediately labeled and stored on ice until each day's sampling was complete. The samples were then hand delivered or shipped to Hall Environmental for DRO analysis. A chain-of-custody (CoC) was completed by Trihydro personnel. Copies of the CoCs are included along with the laboratory analytical reports in Appendix D. Samples were analyzed by Hall Environmental located in Albuquerque, NM. Samples collected after the October 2006 Subsurface Investigation were only analyzed for DRO by method 8015B. The only preservation requirement specified by Hall Environmental is to cool the samples to 4 degrees Celsius or less.

The sampling techniques varied for each of the three 2007 delineation events. During the May 2007 event, small excavations were installed in the locations of the original B-8 and B-9 test pits. Soil samples were collected utilizing a decontaminated trowel and a manual GeoProbe. DRO contaminated soil associated with Test Pit B-9 was delineated and excavated during this event as described in Section 6. However, the May 2007 event did not successfully delineate the DRO contamination associated with Test Pit B-8.

During the August 2007 event, additional soil samples were collected in the vicinity of Test Pit B-8 using the manual GeoProbe. No additional excavating was conducted during this event. The August 2007 event did not fully delineate the B-8 DRO contamination both horizontally and vertically.

To allow for deeper sample collection, Rodgers and Co. Drilling of Albuquerque, NM was contracted to assist with soil sample collection utilizing hollow-stem auger drilling techniques with a CME 75 drill rig. During the December 2007 event, soil samples were collected from decontaminated split spoons. Hollow-stem augers were advanced to the depth directly above the desired sample interval. The decontaminated split spoon sampling device was then hammered through the desired sample interval. Samples were collected directly from the split spoon as soon as it was retrieved. The data obtained during the December 2007 event suggested that the DRO contamination associated with Test Pit B-8 was delineated both horizontally and vertically. Excavation plans proceeded accordingly. Test Pit B-8 sample locations from these three delineation events are illustrated on Figure 5.

4.3.2 EXCAVATION AND CONFIRMATION SAMPLING METHODOLOGY

Excavation and confirmation sampling methodologies were performed in accordance with the 2008 Excavation Work Plan and NMED's approval with direction. Excavation and confirmation sampling activities took place between the months of March 2009 and August 2010.

4.3.2.1 CONFIRMATION SAMPLE LOCATIONS

A total of ten sidewall and base confirmation sample locations were proposed in the 2008 Excavation Work Plan. Three additional locations were added at the suggestion of NMED in the December 11, 2008 Approval with Direction letter provided as Appendix F. These 13 locations, designated CS-1 through CS-13, were strategically located in areas where DRO delineation data was limited in an attempt to fill potential data gaps. Of the 13 approved confirmation sampling locations, 3 exceeded the DRO cleanup standard (CS-2, CS-4, and CS-8) prompting expansion of the excavation. As the excavation was expanded, additional confirmation samples were collected to verify that DRO contaminated soil had been removed. Excavation expansion and confirmation sampling took place from March 2009 through August 2010 continuing until each of the deepest (vertical) and outermost (horizontal) confirmation samples showed DRO concentrations below the 890 mg/kg cleanup standard. By the completion of the August 2010 event, a total of 44 confirmation samples had been collected. The locations of the final confirmation samples are shown on Figure 7. Final confirmation sample analytical results from these events are summarized in Table 2.

4.3.2.2 CONFIRMATION SOIL SAMPLING PROCEDURES

The basic soil sampling procedures used to collect delineation soil samples were utilized for confirmation sampling. These are discussed in detail in Section 4.3.1.2. Soil sample forms are included as Appendix B. Depending on location accessibility, samples were collected using a trowel, hand auger, or bucket of the excavator. If samples were collected from the excavator bucket, care was taken to obtain soil that did not come in contact with the excavator bucket.

4.3.3 FIELD SCREENING

As requested by NMED, field screening was to be performed at each confirmation sampling location and any other location that may be contaminated based on visual observations. During the October 2006 Subsurface Investigation, sample intervals were field screened for TOVs using a MiniRae 2000 photoionization detector (PID). Based on the PID readings recorded during this event, it became evident that a PID is not capable of detecting the DRO contamination in the Fan-out Area. Therefore, a PID was not used during the subsequent sampling events and Gallup

purchased a Magnetic Particle Immunoassay Rapid Assay Kit to field screen during confirmation sampling activities. However, comparisons between laboratory data and preliminary field screening results showed limited correlation. In addition, field screening equipment malfunctions were experienced. NMED was verbally contacted on May 13, 2009 to discuss these issues. As a result, NMED permitted Gallup to proceed with the excavation utilizing visual observations and confirmation sampling results in lieu of field screening to determine whether or not DRO contaminated soil has been removed.

4.3.4 FIELD DOCUMENTATION AND LOGGING

A qualified geologist was on site to log test pits and boreholes during the delineation activities. The logs were completed according to the work plan specifications. Test pit and borehole logs are included as Appendices A and C, respectively. Upon completion of delineation activities, the qualified geologist determined that the lithology of the area had been sufficiently characterized and additional lithologic logging would not be required. Information pertaining to sample collection (delineation and confirmation samples) was recorded on sample forms and borehole logs provided as Appendices B and C, respectively.

Photographs were also used to document field activities. Photographs of site conditions, sample locations, sampling activities, soil samples, and excavation activities were taken as necessary. Applicable photographs, along with a photo log that provides a description of each photograph, are included as Appendix L.

4.3.5 EQUIPMENT DECONTAMINATION PROCEDURES

Sampling equipment that had the potential to come in contact with the soil samples was decontaminated before sampling commenced and after each sample was collected. This includes trowels, augers, the cutting shoe of the manual GeoProbe, and the split spoon sampling device used with the hollow-stem auger drill rig. The sampling devices were decontaminated using a non-phosphate detergent solution followed by two distilled water rinses. Prior to use, the equipment was either air-dried or dried with clean paper towels. Decontaminated sampling devices were stored in a contaminant-free location until use.

4.4 INVESTIGATION DERIVED WASTE

Excavated soils and soil cuttings produced during sampling events have been transported to Gallup's Land Farm as permitted by OCD. Other wastes associated with sampling, including personal protective equipment (PPE), rinse water from decontamination, and other sampling-associated disposables were disposed of appropriately at the refinery.

5.0 REGULATORY CRITERIA

After receiving the results from the October 2006 Subsurface Investigation, it was determined that the contaminant of concern in the Fan-out Area was DRO. The NMED-approved cleanup standard for DRO was originally 200 mg/kg (from "Unknown oil" on Table 2a of NMED's TPH Screening Guidelines for Potable Groundwater (GW-1)).

However, in a correspondence with Gallup personnel in March 2007, NMED agreed to adjust the DRO cleanup level to 890 mg/kg (from "#3 and #6 fuel oil" on Table 2a of NMED's TPH Screening Guidelines for Potable Groundwater (GW-1)). The cleanup standards are included as Appendix M. The only areas discovered during the October 2006 Subsurface Investigation that contained soils with DRO concentrations exceeding the 890 mg/kg cleanup standard were Test Pits B-8 and B-9. Accordingly, delineation and excavation efforts were focused on these two areas as described in Sections 3 and 4 of this report.

6.0 SOIL SAMPLING ANALYTICAL RESULTS

Analytical results of the soils samples collected near Test Pits B-8 and B-9 are discussed below. Quality Assurance and Quality Control procedures were verified through the data validation process which is detailed in Section 6.3.

6.1 TEST PIT B-9

The final Test Pit B-9 excavation measures approximately 6 feet in length (N-S) by 4 feet in width (E-W) and extends to approximately 5 ft bgs. Samples collected from each corner of the excavation at depths of 3 ft bgs and the center of the excavation at a depth of 5 ft bgs showed DRO concentrations below the cleanup standard. Figure 6 illustrates the sample locations and results. Base and sidewall samples are illustrated on Figure 6 in magenta and orange, respectively. A summary of the analytical data obtained from each of the delineation and confirmation sampling events is provided as Table 1. Final confirmation sample results are summarized in Table 2. These analytical results show that soils exceeding the DRO cleanup standard have been excavated from the vicinity of Test Pit B-9.

6.2 TEST PIT B-8

Over 110 soil samples have been collected and analyzed in the vicinity of Test Pit B-8 to verify that DRO contaminated soil exceeding the cleanup standard has been removed. As delineation efforts identified DRO cleanup standard exceedances, the size of the excavation was increased horizontally and/or vertically in the direction of the exceedance, and additional confirmation samples were collected. This process was repeated until the outermost (horizontal) and deepest (vertical) sample locations showed DRO concentrations below the cleanup standard. As illustrated on Figure 7, between delineation and confirmation sampling activities, a total of 44 soil samples showing DRO concentrations below the cleanup standard surround the area that has been excavated. Base and sidewall samples are illustrated on Figure 7 in magenta and orange, respectively. Some samples, for example CS-14, can be considered both base and sidewall samples. CS-14 was collected at 7 ft bgs on the corner of Areas 3 and 4. With respect to Area 3, this is a base sample; with respect to Area 4, this is a sidewall sample. These “base/sidewall” samples are illustrated on Figure 7 in cyan. These analytical results show that soils exceeding the DRO cleanup standard have been excavated from the vicinity of Test Pit B-8. A summary of final confirmation sample analytical data is provided as Table 2.

Laboratory analytical reports for delineation and confirmation sampling events occurring subsequent to the submittal of the October 2006 Subsurface Investigation Report are provided in Appendix D.

6.3 QUALITY ASSURANCE/QUALITY CONTROL PROTOCOL

Analytical data were validated through National Functional Guideline Tier I and Tier II data validation standards. Trihydro Tier II laboratory data validations were performed on the soil sampling data from Hall Environmental Analysis Laboratory, Inc. to determine method compliance, completeness, precision, and accuracy. This data review covered the following 15 data sets: laboratory identification numbers 0705313, 0705361, 0706077, 0708284, 0708324, 0712257, 0903342, 0904327, 0904388, 0905343, 0906074, 0907447, 0910112, 1008920, and 1008A31. Data validation reports are provided with the laboratory analytical reports in Appendix D.

The CoC records and analytical reports were reviewed as part of the data validation process. Samples were analyzed in accordance with the CoCs. The CoC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.

Preservation of samples is assessed by reviewing holding time and receipt temperatures. Preservation is important in preventing volatilization of samples. Three DRO data points were qualified as estimated values, one DRO point was rejected (R), and four motor oil range organics (MRO) data points were rejected (R) for high sample receipt temperatures and analysis past holding time. The rejected DRO datum was not re-sampled because additional data were collected at more extensive horizontal and vertical locations. The sample locations from which MRO data were rejected were not re-sampled because the MRO is not a contaminant of concern based on the October 2006 Subsurface Investigation.

Data validations performed were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-07-003, July 2007 or the USEPA CLP National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA CLP National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Field and laboratory blanks are used to assess accuracy in the field and in the laboratory. Method blank detections were not reported in any of the data sets with the exception of cyanide in data set 0610228. The method blank was only associated with the equipment blank and the associated result was non-detect. Therefore, evidence of cross

contamination was not present in the laboratory. There were no detections of target analytes in the trip blank or equipment blanks samples.

Ten blind duplicates were collected and analyzed with these data sets to assess field and laboratory precision by measuring the relative percent difference (RPD) between sample results. The duplicate samples were collected from B-8 Center (BD5212007), B8_8_20_E_3 (BD082007), B8_12_17_II_3 (BD_12_17_07), CS-8 (BD042109), CS-19 (BD), CS-21 (BD051909), CS-23 (BD), CS-26 (BD-072309), CS-38 (BD1), and CS-33 (BD2). The calculated RPD values were below the limit of 50% for soil indicating acceptable precision with one exception. The field duplicate RPD value for DRO was 74.3% for the duplicate pair from sample B8_8_20_E_3. As a result, DRO was qualified in the parent and duplicate samples to indicate possible poor repeatability.

Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) and matrix spike/matrix spike duplicate (MS/MSD) data are used to assess sample bias (accuracy) as a result of instrumentation or matrix effect, respectively. These data can also be used to assess laboratory precision as a result of instrumentation or matrix effect. A total of 77 data points were qualified or "flagged" as a result of non-conformances with the MS/MSD recoveries or RPD values. Of these 77 points, 53 were for DRO and 24 were for MRO data points.

The data met acceptance levels of precision, accuracy, and completeness. The data sets were complete with the exception of data set 0706077 in which five total data points (one DRO) were rejected as a result of the combination of high sample temperatures and analysis past seven days. Data qualification flag of J indicates an estimated quantified (i.e., detected) value and a UJ indicates an estimated result for non-quantified (i.e., non-detect) values. A data point that is flagged J or UJ indicates that the possible presence or absence of the analyte could be verified at an approximated value; therefore, estimated data is valid for use. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes.

7.0 CONCLUSIONS

Based on the October 2006 Subsurface Investigation, DRO remained the only contaminant of concern exceeding NMED cleanup standards in the Overflow Ditch and Fan-out Area. Two locations, Test Pits B-8 and B-9, were identified where DRO concentrations exceeded NMED's cleanup standard.

A rectangular excavation measuring approximately 4 feet wide by 6 feet long by 5 feet deep was installed at the location of Test Pit B-9. Approximately 3 cubic yards of soil were excavated from the B-9 area and transported to Gallup's Northeast Landfarm as permitted by OCD. As shown on Figure 6, five samples were collected from the outermost extents of this excavation. Each of these samples showed DRO concentrations below the cleanup standard.

The final excavation installed in the vicinity of Test Pit B-8 is illustrated on Figures 5 and 7. Approximately 784 cubic yards of soil have been excavated from this area and transported to Gallup's Northeast Landfarm as permitted by OCD. A total of 44 soil samples showing DRO concentrations below the cleanup standard surround the excavated area.

As shown by the analytical data, DRO contaminated soil exceeding NMED's cleanup standard has been excavated from the vicinity of Test Pits B-8 and B-9. Soils removed from both excavations have been transported to Gallup's Land Farm as permitted by OCD. The excavations currently remain open as Gallup is awaiting NMED's approval of this report prior to backfilling the excavations with clean backfill material. Upon NMED approval, Gallup intends to backfill the excavations in a timely manner. Once backfilled, Gallup believes that no further remediation activities need to be conducted in the Overflow Ditch and Fan-out Area.

TEST PIT LOGS

FIGURE 3a. TEST PIT LOG
Ciniza Refinery, Gallup, New Mexico

Project/Job#: 072-013-001 Logged By: Grant Price Date: 5/21/2007 - 5/24/2007
 Contractor: _____ Operator: Steve Morris Test Pit: B-9
 Location: B8 Overflow Ditch Elevation: _____ Equipment: Case Backhoe
 Photographs: 685, 687, 689, 721 Coordinates(x,y,z): _____

Graphic Log

Field Measures

Depth	TOV	pH
	none taken	none taken

Excavation dimensions: 6' N-S
 4' E-W
 3' Deep (5/21/2007)
 TD increased to 5 ft bgs on 5/24/2007

Depth to Water/ Liquid	
Depth	Type
None encountered	

Depth (ft-bgs)	Description
0 - 2.5	Brown clayey silt, damp, mostly loose, low plasticity, no staining, no odor.
2.5 - 5	Brown silty clay, damp/moist, low plasticity, stiff, slightly siltier in center of excavation. Some black staining noted, very faint odor. Odor does not seem to be associated with staining.

FIGURE 3a. TEST PIT LOG

RE: Fan Out Area Sampling

Order No.: 0610228

Dear Regina Allen:

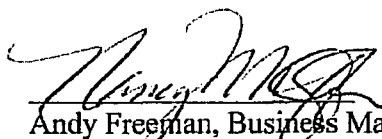

Hall Environmental Analysis Laboratory, Inc. received 26 sample(s) on 10/20/2006 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

ANALYTICAL SUMMARY REPORT

November 08, 2006

Anne Thorne
Hall Environmental-Albuquerque
4901 Hawkins NE
Albuquerque, NM 87109

Workorder No.: B06101716

Project Name: 0610228

Energy Laboratories Inc received the following 25 samples from Hall Environmental-Albuquerque on 10/24/2006 for analysis.

Sample ID	Client Sample ID	Collect Date	Receive Date	Matrix	Test
B06101716-001	0610228-01C-B7-2 ft	10/17/06 15:45	10/24/06	Soil	Total Cyanide Cyanide Distillation

Tier II Data Validation Report

Client: Giant Refining Co. Ciniza	Laboratory: Hall Environmental Analysis Laboratory, Inc. and Energy Laboratories, Inc. (Cyanide results)
Project Name: Fan Out Area	Sample Matrix: Soil
Project Number: 072-006-001	Sample Start Date: October 17, 2006
Date Validated: November 22, 2006	Sample End Date: October 18, 2006
Samples Analyzed: B7-2', B7-5', B8-2', B8-5', B9-2', B9-5', B10-2', B10-5', B10-5' MS, B10-5' MSD, BD101806, Trip Blank(0610228-12), B1-2', B1-5', B2-2', B2-5', B3-2', B3-5', B4-2', B4-5', B5-2', B5-5', B6-2', B6-5', EB101806, and EB101706	
Parameters: VOCs, SVOCs, Metals, Cyanides, and DRO	
Laboratory Project ID: 0610228	
Data Validator: Lee Grater, Environmental Chemist	
Precision, Accuracy, Method Compliance, Completeness Assessment	
Precision Acceptable Comments: Precision is the measure of variability of sample measurements. Field precision is determined by a comparison of field duplicate sample results. Laboratory precision is determined by examining the laboratory duplicate results. Evaluation of both the field and laboratory duplicates for precision was accomplished using the relative percent difference (RPD). The RPD is defined as the difference between the primary and duplicate samples divided by the mean and expressed as a percentage. Sample B3-2' (0610228-17) was collected as the parent for sample BD101806 (0610228-11). All field duplicate and MS/MSD RPD values were within control limits, with one exception. One MS/MSD RPD value for selenium was reported to be above the control limits. All associated results will be qualified 'J/UJ' due to possible poor repeatability.	
Accuracy Acceptable Comments: Accuracy is a measure of sampling and analysis bias. Field accuracy is determined by collecting field, trip and equipment blanks to monitor for possible ambient or cross contamination during sampling. One trip, and two equipment blanks were collected. There were no detections reported in any of the associated blanks. Laboratory accuracy is measured by evaluating laboratory control sample (LCS) and MS/MSD recoveries. LCS and MS/MSD recoveries were compared to published or laboratory control limits. All laboratory control and MS/MSD recoveries were within control limits, with a few exceptions. Two MS/MSD recoveries for selenium were reported to be outside of the control limits. All associated results will be qualified 'J/UJ' due to a possible low bias.	
Method Compliance Acceptable Comments: Method compliance was determined by reviewing the holding times, detection limits, surrogate recoveries, method blanks, and laboratory control samples against method specific requirements. The analyte cyanide was detected in one method blank. No qualification is necessary since the associated method blank was only associated with the equipment blanks and since all associated samples were non-detect. All other criteria for method compliance were acceptable. The laboratory met extraction and analytical hold times for all requested analyses.	
Completeness Acceptable Comments: Completeness is the overall ration of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody and laboratory analytical methods. Completeness also includes a review of the analytical reports and QC summary report. All data were presented in a clear and complete manner. A total of 43 data points were assigned "J" or "UJ" data qualifiers as a result of this data validation review. No data points were qualified or rejected; therefore, this data sets is 100% complete	

Validation Criteria Checklist	
Data validation flags used in this review: The data flags "J" and "UJ" were used to denote that the reported values are estimated, or that the method reporting limit is estimated in this sample matrix.	
1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: The laboratory noted that the cyanide samples were received by Energy Laboratories at 14°C. The surrogate in the DRO analysis for sample B9-2' (610228-05) failed to recover because the sample was diluted due to high concentrations of target compounds present in the sample.	
2. Were sample chain-of-custody forms complete?	Yes
Comments: The sample recorded on the chain-of-custody document as sample B3-5', collected on 10/18/06, at 1050 hrs, should have been labeled B3-2', (0610228-17), which was collected on 10/20/06. The chain-of-custody forms were complete from the field to the laboratory in all other respects.	
3. Were detection limits in accordance with the QAPP, permit, or method?	Yes
Comments: All detection limits were acceptable; however, some dilutions were required in order to determine concentrations for target constituents. Dilutions were reviewed and were acceptable for this data set.	
4. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: All reported analytical methods were in compliance with those noted on the chain-of-custody.	
5. Were samples received in good condition?	No
Comments: All samples were received in good condition at temperatures of 1 degree Celsius. The laboratory noted that the cyanide samples were received by Energy Laboratories at 14°C. As a result of this occurrence, all cyanide results will be assigned "UJ" or "J" data qualifiers, denoting the samples were compromised in shipment, and that the reported results are estimated values.	
6. Were sample holding times met?	Yes
Comments: All samples were analyzed within the acceptable holding times.	
7. Were correct concentration units reported?	Yes
Comments: All sample results were reported in units of mg/kg. These units are acceptable when reporting concentrations for the associated matrix (soil).	
8. Do the laboratory reports include all constituents requested to be reported for a specific analytical method?	Yes
Comments: The laboratory appeared to have reported all constituents as requested by the client.	
9. Were the reporting requirements for flagged data met?	Yes
Comments: No data were flagged by the laboratory; however, the laboratory did note any dilutions and re-analyses that were performed on the associated samples.	
10. Is there indication that the continuous calibration verification was within acceptable limits?	Yes
Comments: There were no continuous calibration results noted in the data sets associated with the water samples; however, it is assumed that all results were acceptable based on other QC data.	
11. Were the instrument calibrations within method control limits?	Yes
Comments: There were no instrument calibration results noted in the data sets associated with the water samples; however, it is assumed that all results were acceptable based on other QC data.	
12. Were method blank samples analyzed on a 5% basis?	Yes
Comments: Method blank samples were analyzed on a 5% basis for all analyses and all associated batches.	
13. Were method blank detections reported for this data set?	Yes
Comments: The analyte cyanide (0.002 mg/L) was detected in the method blank associated with sample A2006-10_26_4_CN-01. No qualification is necessary since this method blank is only associated with equipment blanks and since all associated samples were non-detect.	

Validation Criteria Checklist

14. Were matrix spike samples prepared on a 5% basis?	No
Comments: For the DRO and MRO analysis, a MS/MSD pair was prepared from sample 0610228-08. For the analysis of cyanide, two MS/MSD pairs were prepared from samples from other clients sample sets. For the Method 8260B analysis, two MS/MSD pairs were prepared from samples 0610228-04, and -21. For the Method 8270C analysis, no MS samples were analyzed. The Method 8270C analysis will be accepted on the basis of the LCS and MB results. For the Method 7471 analysis, two MS/MSD pairs were prepared from samples 0610228-15, and -24. For the Method 6010 analysis, three MS/MSD pairs were prepared from samples 0610228-11, -24, and -26.	
15. Were matrix spike recoveries within acceptable limits?	No
Comments: For samples 0610228-11B and 24B, the MS (0% and 34.2%, respectively)/MSD (54.4% and 37.8%, respectively) recoveries for selenium were reported to be outside of the control limits of 75-125%. In addition, for sample 11B, the RPD value for selenium (200%; acceptable limit 30%) was reported to be above the acceptable limit of 30%. All associated results will be qualified 'J/UJ' due to possible poor repeatability and a possible low bias.	
16. Were laboratory control samples analyzed on a 5% basis?	Yes
Comments: Laboratory control samples were analyzed on a 5% basis for all analyses.	
17. Were laboratory control recoveries within acceptable limits?	Yes
Comments: All laboratory control recoveries were within control limits.	
18. Were surrogate recoveries within control limits?	No
Comments: In sample B9-2', the surrogate DNOP (0%; acceptable range 61.7-135%) was reported to be outside of the control limits. This is acceptable per the method. In sample B9-2', the surrogates 4-terphenyl-d14 (27.6%; acceptable range 34.6-151%) and phenol-d5 (36.6%; acceptable range 37.6-118%) were recovered outside of the control limits. No qualification is necessary since all other surrogate recoveries were acceptable.	
19. Were equipment blanks and field blanks collected on a 10% basis?	Yes
Comments: One trip, and two equipment blanks were collected during this sampling event.	
20. Were detections found in trip blanks, equipment blanks, or field blanks?	No
Comments: There were no detections in the trip, equipment, or field blanks.	
21. Were field duplicates collected on a 10% basis?	Yes
Comments: One field duplicate was collected in this sampling event. BD101806 is a duplicate of B3-2' (0610228-11).	
22. Were field duplicate RPD values less than 30%?	Yes
Comments: All field duplicate RPD values were less than the acceptable value of 30% (Table 2).	
23. General Comments: All data were presented in a clear and complete manner. Because the cyanide samples were received by Energy Laboratories, Inc., at a temperature of 14°C, all cyanide results will be "J" or "UJ" flagged as estimated values. Due to the consistent low spike recoveries for selenium in MS/MSD samples prepared from this sample set, it is apparent that there is a low bias in the selenium results due to sample matrix interferences, and all selenium results will be "UJ" or "J" flagged as estimated values in this sample matrix. No data points were rejected; therefore these data sets are 100% complete.

RE: Additional Fan out area samples

Order No.: 0705313

Dear Steve Morris:

Hall Environmental Analysis Laboratory, Inc. received 12 sample(s) on 5/21/2007 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: May 2007 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: May 21, 2007
Date Validated: June 18, 2009	Sample End Date: May 21, 2007
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0705313	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Additionally, field accuracy was established by collecting an equipment blank to monitor for possible ambient or cross contamination during sampling. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Tier II Data Validation Report Summary

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
BD 5212007	0705313-01
B-8 NW	0705313-02
B-8 NE	0705313-03
B-8 SW	0705313-04
B-8 SE	0705313-05
B-8 Center	0705313-06
B-9 NW	0705313-09
B-9 NE	0705313-10
B-9 SW	0705313-11
B-9 SE	0705313-12
EB	0705313-13
B9 Center	0705313-14

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ✓ Field Duplicates
- ✓ Equipment Blank

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified as a result of this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	No
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags used by the laboratory? If yes, define.	No
Comments: The laboratory did not use data qualification flags with this data set.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions up to 10 times were applied to some of the samples in this data set. The final usability with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 2.0°C, as noted in the Sample Receipt Checklist. The shipping cooler was marked as being received in good condition by the laboratory on the Sample Receipt Checklist.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set.	
14. Were matrix spike recoveries within laboratory-specified limits?	N/A
Comments: Matrix spike samples were not prepared for this data set.	

VALIDATION CRITERIA CHECKLIST		
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes	
Comments: Laboratory control samples were reported on a greater than 5% basis.		
16. Were laboratory control recoveries within laboratory-specified limits?	Yes	
Comments: Laboratory control recoveries were within laboratory-specified limits.		
17. Were surrogate recoveries within laboratory control limits?	Yes	
Comments: Surrogate recoveries were within laboratory control limits.		
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes	
Comments: One equipment blank (EB) was submitted with this data set which is at least 10% the total number of samples.		
19. Were detections found in trip blanks, equipment blanks, or field blanks?	No	
Comments: There were no detections in the equipment blank.		
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes	
Comments: One field duplicate, BD 5212007 was collected as a duplicate of sample B-8 Center, which is at least 10% the total number of samples.		
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	Yes	
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples as shown in the Field Duplicate Summary table at the end of this report.		
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A	
Comments: Laboratory duplicates were not prepared for this data set.		

FIELD DUPLICATE SUMMARY

Client Sample ID: B-8 Center Field Duplicate Sample ID: BD5212007			
Analyte	Laboratory Result (mg/kg)	Duplicate Result (mg/kg)	Relative Percent Difference (RPD)
DRO	790	1300	48.8%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.			

COVER LETTER

RE: Additional Fan Out Area Samples

Order No.: 0705361

Dear Steve Morris:

Hall Environmental Analysis Laboratory, Inc. received 8 sample(s) on 5/23/2007 for the analyses presented in the following report.

This report is an addendum to the report dated May 29, 2007. This is an updated report.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read 'Andy Freeman'.

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: May 2007 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: May 23, 2007
Date Validated: June 18, 2009	Sample End Date: May 23, 2007
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0705361	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Laboratory accuracy and precision was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999.

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
B8 extra 2'	0705361-01
B8 new NE 3'	0705361-02
B8 new NW 3'	0705361-03
B8 new SW 3'	0705361-04
B8 new NE 5'	0705361-05
B8 new NW 5'	0705361-06
B8 new SE 5'	0705361-07
B9 new Center 5'	0705361-08

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified as a result of this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST

1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: The laboratory noted in the case narrative the following non-conformance. Method 8015B DRO Analysis: The surrogate DNOP, associated with sample B8 new SW 3', was not recovered due to dilution.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Spike recovery outside accepted recovery limits.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions from 10 to 50 times were applied by the laboratory to samples B8 new SW 3' and B8 new SE 5' for the analysis of DRO. The final usability of the data with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 4.0°C, as noted in the Sample Receipt Checklist. The shipping cooler was marked as being received in good condition by the laboratory on the Sample Receipt Checklist.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	

Trihydro

VALIDATION CRITERIA CHECKLIST	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set.	
14. Were matrix spike recoveries within laboratory-specified limits?	N/A
Comments: Matrix spike samples were not prepared for this data set.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis.	
16. Were laboratory control recoveries within laboratory-specified limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits. Method 8015B DRO Analysis: The surrogate di-n-octyl phthalate (DNOP), associated with sample B8 new SW 3', was not recovered due to dilution. This is acceptable and requires no further action.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: There were no blank samples submitted with this data set.	
19. Were detections found in trip blanks, equipment blanks, or field blanks?	N/A
Comments: There were no blank samples submitted with this data set.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: Field duplicates were not collected with this data set.	
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	N/A
Comments: Field duplicates were not collected with this data set.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.

FAX (505) 722-0210

RE: Additional Fan Out Area Samples

Order No.: 0706077

Dear Steve Morris:

Hall Environmental Analysis Laboratory, Inc. received 4 sample(s) on 6/5/2007 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: May 2007 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: May 23, 2007
Date Validated: June 18, 2009	Sample End Date: May 23, 2007
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0706077	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Laboratory accuracy and precision was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999.

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
B8 NEW SE-S1 3'	0706077-01
B8 NEW SE-S1 5'	0706077-02
B8 NEW SE-S2 3'	0706077-03
B8 NEW SE-S2 5'	0706077-04

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ⊗ Data Completeness
- ✓ COC Documentation
- ⊗ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were qualified as a result of this validation for analysis past holding time and high sample temperatures.

Data qualifiers used during this validation included:

- J – Estimated concentration
- R - Rejected, Data not usable

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. There were five data points rejected. The data completeness measure for this data package is 37.5%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	No
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags used by the laboratory? If yes, define.	No
Comments: The laboratory did not use data qualification flags with this data set.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions up to 10 times were applied to some of the samples in this data set. The final usability of the data with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	No
<p>Comments: Samples were received intact and in good condition. Cooler temperatures were above the 4°C +/- 2°C acceptable range at 11.0°C, as noted in the Sample Receipt Checklist. The shipping cooler was marked as being received in good condition by the laboratory on the Sample Receipt Checklist.</p> <p>Since the samples were analyzed past the recommended holding time of 14 days for soil samples and the receipt temperature was above the recommended maximum temperature of 6°C, samples were qualified as J for detections and non-detections were rejected. The National Functional Guidelines recommends the rejection of non-detections in samples with temperatures above 6°C analyzed past 7 days.</p>	
7. Were samples analyzed within method specified or technical holding times?	No
Comments: Samples were analyzed past the recommended hold time as noted in question 6. Data were qualified as J or R.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	

VALIDATION CRITERIA CHECKLIST		
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No	
Comments: Matrix spike samples were not prepared for this data set.		
14. Were matrix spike recoveries within laboratory-specified limits?	N/A	
Comments: Matrix spike samples were not prepared for this data set.		
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes	
Comments: Laboratory control samples were reported on a greater than 5% basis.		
16. Were laboratory control recoveries within laboratory-specified limits?	Yes	
Comments: Laboratory control recoveries were within laboratory-specified limits.		
17. Were surrogate recoveries within laboratory control limits?	Yes	
Comments: Surrogate recoveries were within laboratory control limits.		
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No	
Comments: There were no blank samples submitted with this data set.		
19. Were detections found in trip blanks, equipment blanks, or field blanks?	N/A	
Comments: There were no blank samples submitted with this data set.		
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes	
Comments: There were no field duplicates collected with this data set.		
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	N/A	
Comments: There were no field duplicates collected with this data set.		
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A	
Comments: Laboratory duplicates were not prepared for this data set.		

DATA QUALIFICATION SUMMARY

RE: Fan Out Area

Order No.: 0708284

Dear Steve Morris:

Hall Environmental Analysis Laboratory, Inc. received 15 sample(s) on 8/21/2007 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read 'Andy Freeman', written over a horizontal line.

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Completeness	Acceptable				
Comments: Completeness is the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody and laboratory analytical methods. Completeness also includes a review of the analytical reports and QC summary report. No data were rejected; therefore, this data set is 100% complete.					

Validation Criteria Checklist	
Data validation flags used in this review: J-estimated value and UJ-estimated value; non-detect	
1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: In data set 0708324, the laboratory noted that sample B8_8_26_H_5 was labeled incorrectly and per the project manager's request the ID was changed to B8_8_21_H_5.	
2. Were sample chain-of-custody forms complete?	No
Comments: All chain-of-custody forms were complete from the field to the laboratory, with one exception. In data set 0708324, the laboratory noted that sample B8_8_26_H_5 was labeled incorrectly and per the project manager's request the ID was changed to B8_8_21_H_5.	
3. Were detection limits in accordance with the QAPP, permit, or method?	Yes
Comments: Detection limits were acceptable. Some dilutions were required; however, they were necessary due to high concentrations of target analytes.	
4. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: All reported analytical methods were in compliance with those requested on the chain-of-custody form.	
5. Were samples received in good condition?	No
Comments: Sample temperatures were reported to be high in both data sets (0708324: 18 degrees Celsius and 0708284: 13 degrees Celsius). This occurrence does not seem to negatively affect the quality of the data since the samples were delivered shortly after they were sampled and were not yet cooled, and since they were analyzed within hold time.	
6. Were sample holding times met?	Yes
Comments: All samples were extracted and analyzed within the acceptable hold time.	
7. Were correct concentration units reported?	Yes
Comments: Results were reported in units of mg/kg, which is acceptable based on the soil matrix.	
8. Do the laboratory reports include all constituents requested to be reported for a specific analytical method?	Yes
Comments: Reported constituents were in accordance with those requested on the chain-of-custody form.	
9. Were the reporting requirements for flagged data met?	Yes
Comments: No data were qualified by the laboratory; however, the laboratory did qualify quality control data due to out of range recovery results.	
10. Is there indication that the continuous calibration verification was within acceptable limits?	Yes
Comments: Calibration data were not included as part of this data review; however, all data seem to be acceptable based on other QC data.	
11. Were the instrument calibrations within method control limits?	Yes
Comments: Calibration data were not included as part of this data review; however, all data seem to be acceptable based on other QC data.	
12. Were method blank samples analyzed on a 5% basis?	Yes
Comments: Method blanks were reported on a greater than 5% basis.	
13. Were method blank detections reported for this data set?	No
Comments: There were no detections reported in the method blanks.	
14. Were matrix spike samples prepared on a 5% basis?	Yes
Comments: In data set 0708324, the MS/MSD pair was prepared from sample B8_8_20_M_3 of this data set. In data set 0708284, the MS/MSD pair was prepared from sample B8_8_20_G_3 of this data set.	

Validation Criteria Checklist

15. Were matrix spike recoveries within acceptable limits?	No
<p>Comments: In data set 0708324, the MS/MSD recoveries for DRO (3020% and -3230%; acceptable range 67.4-117%) were reported to be outside of the control limits. In addition, the RPD value (78.6%; acceptable range 0-17.4%) was reported to be above the acceptable RPD limit. As a result, all data will be qualified 'J/UJ' due to possible biased results and possible poor repeatability.</p> <p>In data set 0708284, the MS/MSD recoveries for DRO (-6.42% and 20.5%; acceptable range 67.4-117%) were reported to be outside of the control limits. As a result, all results will be qualified 'J/UJ' due to a possible low bias.</p>	
16. Were laboratory control samples analyzed on a 5% basis?	Yes
Comments: Laboratory control samples were analyzed on a 5% basis.	
17. Were laboratory control recoveries within acceptable limits?	Yes
Comments: All laboratory control recoveries were acceptable.	
18. Were surrogate recoveries within control limits?	No
Comments: In data set 0708284, the surrogate recoveries for both equipment blanks (165% and 173%; acceptable range 58-140%) were reported to be outside of the control limits. No qualification is necessary since there were no detections reported in either equipment blank.	
19. Were equipment blanks and field blanks collected on a 10% basis?	Yes
Comments: A total of two equipment blanks were collected in data set 0708284.	
20. Were detections found in trip blanks, equipment blanks, or field blanks?	No
Comments: There were no detections reported in the equipment blanks.	
21. Were field duplicates collected on a 10% basis?	Yes
Comments: Sample BD082007 was collected as a duplicate of sample B8_8_20_E_3.	
22. Were field duplicate RPD values less than 30%?	No
Comments: The RPD value was reported to be above the acceptable limit. All associated results will be qualified 'J' since a high RPD value may indicate poor repeatability.	
23. General Comments: Data were presented in a clear and complete manner. No data were rejected; therefore, this data set is 100% complete.	

**TABLE 1. DATA QUALIFICATION, CINIZA ADDITIONAL SOIL SAMPLING AND EXCAVATION
GIANT REFINING, CINIZA, NEW MEXICO**

Analyte	Sample ID	Laboratory Assigned ID	Laboratory Result (mg/kg)	Flag	Reason
DRO	All Samples	All Samples (0708284)	Detect/Non-Detect	J (Detect)/UJ (Non-Detect)	Out of Range MS/MSD Results
DRO	All Samples	All Samples (0708324)	Detect/Non-Detect	J (Detect)/UJ (Non-Detect)	Out of Range MS/MSD Results
DRO	B8_8_20_E_3	0708284-07	2200	J	High RPD Value
DRO	BD082007	0708284-12	4800	J	High RPD Value
J – Indicates estimated detection. UJ – Indicates estimated detection below the reporting limit.					

**TABLE 2. FIELD DUPLICATE SUMMARY, CINIZA ADDITIONAL SOIL SAMPLING AND EXCAVATION
GIANT REFINING, CINIZA, NEW MEXICO**

Sample ID: B8_8_20_E_3/Field Duplicate ID: BD082007			
Analyte	Laboratory Result (mg/kg)	Duplicate Result (mg/kg)	Relative Percent Difference (RPD)
Diesel Range Organics	2200	4800	74.3%
Field duplicate RPD control limits should not exceed 30% as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, February 1988.			

COVER LETTER

Thursday, December 20, 2007

FAX (505) 722-0210

RE: Fan Out Area December 07

Order No.: 0712257

Dear Steve Morris:

Hall Environmental Analysis Laboratory, Inc. received 18 sample(s) on 12/18/2007 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: October 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: October 1, 2009
Date Validated: December 18, 2009	Sample End Date: October 2, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0910112	
Data Validator: Nella Dagnillo, Chemical Engineer, E.I.T.	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from laboratory duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
CS-29	0910112-01
CS-30	0910112-02
CS-31	0910112-03
A-1	0910112-04
A-2	0910112-05
A-3	0910112-06

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified during this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100% and is acceptable.

VALIDATION CRITERIA CHECKLIST	
1. Was the report free of any non-conformances related to the analytical data identified by the laboratory?	Yes
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags or any other notes used by the laboratory? If yes, define.	No
Comments: The laboratory did not use data qualification flag with this data set.	
3. Were sample COC forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions were not required for the samples and analyses in this data set.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 5.9°C, as noted in the Sample Receipt Checklist.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank samples free of analyte contamination?	Yes
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set.	

VALIDATION CRITERIA CHECKLIST		
14. Were MS/MSD percent recoveries and MS/MSD RPD values within data validation or laboratory QC limits?	N/A	
Comments: Matrix spike samples were not prepared for this data set.		
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes	
Comments: Laboratory control samples were reported on a greater than 5% basis. Laboratory control samples were not prepared for motor oil analyses. However, the diesel range organics LCS/LCSD were used to evaluate the accuracy of the motor oil analyses.		
16. Were LCS/LCSD percent recoveries and LCS/LCSD RPD values within laboratory QC limits?	Yes	
Comments: Laboratory control recoveries were within laboratory-specified limits.		
17. Were surrogate recoveries within laboratory control limits?	Yes	
Comments: Surrogate recoveries were within laboratory control limits.		
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No	
Comments: Blank samples were not submitted with this data set.		
19. Were the trip blank, field blank, and/or equipment blank samples free of analyte contamination?	N/A	
Comments: Blank samples were not submitted with this data set.		
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No	
Comments: Duplicate samples were not submitted with this data set.		
21. Were field duplicate RPD values within data validation QC limits (soil 0-50%, water 0-30%, or air 0-25%)?	N/A	
Comments: Duplicate samples were not submitted with this data set.		
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A	
Comments: Laboratory duplicates were not prepared for this data set.		

COVER LETTER

Monday, August 30, 2010

Ed Riege

RE: Far-out Area

Order No.: 1008A31

Dear Ed Riege:

Hall Environmental Analysis Laboratory, Inc. received 1 sample(s) on 8/25/2010 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology.

Please do not hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Freeman".

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: Gallup-2010 Environmental Compliance	Sample Matrix: Soil
Project Number: 697-039-001	Sample Start Date: August 23, 2010
Date Validated: September 8, 2010	Sample End Date: August 25, 2010
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 1008920 and 1008A31	
Data Validator: Aubrey L. Farris, E.I.T., Civil Engineer	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs and laboratory duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of matrix spike (MS) and matrix spike duplicate (MSD) samples, and of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Tier II Data Validation Report Summary

SAMPLE NUMBERS TABLES

Data Set 1008920

Data Set 1008A31

Client Sample ID	Laboratory Sample Number
CS-35	1008A31-01

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (CoC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ CoC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ✓ Matrix Spike/Matrix Spike Duplicates (MS/MSD)
- ✓ Field Duplicates

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified during this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100% and is acceptable.

VALIDATION CRITERIA CHECKLIST	
1. Was the report free of any non-conformances related to the analytical data identified by the laboratory?	No
Comments: The laboratory identified the following non-conformances related to data set 1008920. Analytical Comments for Method 8015DRO_S, Sample 1008920-08A: DNOP not recovered due to dilution.	
2. Were data qualification flags or any other notes used by the laboratory? If yes, define.	No
Comments: The laboratory did not use data qualification flag with this data set.	
3. Were sample CoC forms complete?	Yes
Comments: The CoC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions were not required for the samples and analyses in this data set with the following exception. Dilutions of 10 times were applied to sample CS-41 by Method 8015B in data set 1008920. The final usability of the data with respect to detection limits and dilutions will be determined by the project staff.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or CoC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the CoC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within and outside the 4°C +/- 2°C acceptable range at 5.3°C (data set 1008920) and 7.3°C (data set 1008A31), as noted in the Sample Receipt Checklist. The cooler temperature that was above 6°C was judged as acceptable since the samples were delivered to the lab directly after collection and had not had sufficient time to cool.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: The laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank samples free of analyte contamination?	Yes
Comments: Method blank detections were not reported for this data set.	

VALIDATION CRITERIA CHECKLIST

13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: The matrix spike samples for batch 23513 were prepared from sample CS-39 of data set 1008920. Matrix spike samples were not prepared for batch 23548 of data set 1008A31. The laboratory control sample results were used to evaluate the accuracy and precision of this data.	
14. Were MS/MSD percent recoveries and MS/MSD RPD values within data validation or laboratory QC limits?	Yes
Comments: The MS and MSD recoveries and RPD values were within laboratory-specified limits.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis. Laboratory control samples were not prepared for motor oil analyses. However, the diesel range organics LCS/LCSD were used to evaluate the accuracy of the motor oil analyses.	
16. Were LCS/LCSD percent recoveries and LCS/LCSD RPD values within laboratory QC limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: Blank samples were not submitted with this data set.	
19. Were the trip blank, field blank, and/or equipment blank samples free of analyte contamination?	N/A
Comments: Blank samples were not submitted with this data set.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: Two field duplicates, BD1 was collected as a duplicate of sample CS-38 and BD2 was collected as a duplicated of CS-33.	
21. Were field duplicate RPD values within data validation QC limits (soil 0-50%, water 0-30%, or air 0-25%)?	Yes
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples. Field duplicate RPD values are presented in the Field Duplicate Summary Table at the end of this report. The results for CS-38 and BD1 were undetected; therefore, not RPD could be calculated.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.	

Trihydro

FIELD DUPLICATE SUMMARY

Client Sample ID: CS-33 Field Duplicate Sample ID: BD2			
Analyte	Laboratory Result (mg/Kg)	Duplicate Result (mg/Kg)	Relative Percent Difference (RPD)
Diesel Range Organics (DRO)	58	76	26.9%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

July 22, 2008

Mr. Ed Riege
Environmental Superintendent
Western Refining, Gallup Refinery
Route 3, Box 7
Gallup, New Mexico 87301

**RE: NOTICE OF DISAPPROVAL
RAILROAD RACK LAGOON FAN-OUT AREA
EXCAVATION WORK PLAN
WESTERN REFINING SOUTHWEST, INC. GALLUP REFINERY
EPA ID #: NMD000333211
HWB-GRCC-07-002**

Dear Mr. Riege:

The New Mexico Environment Department (NMED) has reviewed Western Refining Southwest, Inc. Gallup Refinery's (the Permittee) *Railroad Rack Lagoon Fan-out Area Excavation Work Plan* (Excavation Plan), dated May 2, 2008 and hereby issues this Notice of Disapproval (NOD). NMED has the following comments.

Comment 1

In the third paragraph of the Permittee's cover letter dated May 12, 2008, the Permittee states "[f]or example, in areas in which the sampled materials had no detectable levels of contaminants at 3 feet, we plan to excavate to depths of 5 feet. Similarly in the few areas at which there is contamination at greater depths, we plan to excavate to far greater depths than which we found no detectable levels of contaminants. Similarly, you will notice that at point L1 we found no detectable levels of contamination; yet, on a conservative basis, we plan to excavate an areal extent far more extensive than the clean point L1 would indicate."

Mr. Riege
Western Refining Gallup Refinery
July 22, 2008
Page 2

Location L-1 was not found in Figure 1. The Permittee must revise the Excavation Plan to cite the correct reference or submit a revised Figure 1 to identify the location of point L1.

Comment 2

In the "Completed Field Work" Section of the Excavation Plan, the Permittee references test pit location B-9; however, this location is not found in Figure 1. The Permittee must provide an additional figure to the Excavation Plan that identifies all the original soil boring locations as identified in Attachment 1 of NMED's September 19, 2006 *Approval with Modifications Work Plan for Investigation of the Overflow Ditch and Fan-Out of Area Railroad Rack Lagoon, SWMU #8*.

Comment 3

The Permittee states in the Excavation Plan on page one, paragraph 3, that soil sampled at location B-9 was below the diesel range organics (DRO) clean-up standard of 890 mg/kg. This conflicts with information provided in the October 2, 2007 letter from Trihydro to Jim Lieb which states that the center sample of the excavation at B-9 at three feet (ft) below ground surface (bgs) exceeded the DRO clean-up standard of 890 mg/kg. A hand auger was then used to collect an additional center sample at B-9 at five ft and detected DRO concentrations were below 890 mg/kg.

It is not clear if the contaminated soil detected at B-9 from the three foot to five foot interval has been removed. The Permittee must revise the Excavation Plan to clarify this discrepancy and explain if the contaminated soil at B-9 at the three ft to five ft depth interval has been removed. If the contamination at B-9 has not been removed, the Excavation Plan must address removal of the contaminated soil.

Comment 4

From review of the Excavation Plan and Figure 1, the Permittee has not delineated the contamination in the vicinity of location B-8 to the southwest, approximately six feet directly west of borehole M, in the outflow ditch between sample locations B-8 and B-9. Because soil at locations B-8 and possibly B-9 contain DRO concentrations above 890 mg/kg, it is likely that similar contamination is present in soils in the overflow ditch between B-8 and B-9.

The Permittee must revise the Excavation Plan to propose additional sampling and analyses of soils located between B-8 and B-9. A figure must be provided depicting the proposed sampling locations. This location will also satisfy the need for step-out sampling directly west of borehole M. Depending on the sample analytical results, additional excavation may be needed in the vicinity of between B-8 and B-9.

Mr. Riege
Western Refining Gallup Refinery
July 22, 2008
Page 3

Comment 5

The Excavation Plan does not address confirmation of the complete removal of soils containing DRO concentrations greater than the applicable screening level. The Permittee must revise the Excavation Plan to discuss confirmation sampling and include a figure depicting the proposed frequency of collection of confirmation samples. The Permittee must also list what chemical analyses will be performed on the confirmation samples.

Comment 6

On page three and four of the Excavation Plan, the Permittee states that the excavated soil will be disposed of in Gallup's Northeast Oil Conservation Division (OCD) Land Farm. The Permittee must obtain permission from OCD prior to disposing the soil in the Landfarm. Both NMED and OCD must be informed of the final soil disposal location. The Permittee must revise the Excavation Plan to state that the Permittee will obtain approval from OCD prior to disposing of the excavated soil in the OCD Landfarm.

Comment 7

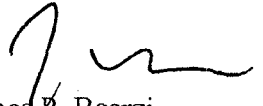

As a general comment, NMED recommends the Permittee wait until the results of confirmation sample analyses indicate the DRO contamination is below 890 mg/kg before backfilling the remedial excavation.

Mr. Riege
Western Refining Gallup Refinery
July 22, 2008
Page 4

The Permittee must address all comments contained in this NOD and submit a revised Excavation Plan. The revised Excavation Plan must be accompanied with a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. The Permittee must also submit an electronic copy of the Revised Excavation Plan with all edits and modifications shown in redline-strikeout format. The revised Excavation Plan is due to NMED on or before September 22, 2008.

If you have any questions regarding this letter please contact Hope Monzeglio of my staff at (505) 476-6045.

Sincerely,

James P. Bearzi

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

December 11, 2008

Mr. Ed Riege
Environmental Superintendent
Western Refining, Gallup Refinery
Route 3, Box 7
Gallup, New Mexico 87301

**RE: APPROVAL WITH DIRECTION
RAILROAD RACK LAGOON FAN-OUT AREA EXCAVATION WORK PLAN
WESTERN REFINING SOUTHWEST, INC. GALLUP REFINERY
EPA ID #: NMD000333211
HWB-GRCC-07-002**

Dear Mr. Riege:

The New Mexico Environment Department (NMED) has reviewed Western Refining Southwest, Inc. Gallup Refinery's (the Permittee) *Railroad Rack Overflow Ditch and Fan-out Area Soil Investigation Work Plan* (Work Plan), dated September 17, 2008. This Work Plan was submitted in response to NMED's July 22, 2008 *Notice of Disapproval Railroad Rack Lagoon Fan-out Area Excavation Work Plan*. NMED hereby issues this Approval with Direction. The Permittee must adhere to all requirements established within this letter.

Comment 1

In Section 2.1.2 (Vertical Delineation), page 2-2, the Permittee states "[e]xisting borehole B8(B8-NEW-SE-S1) was drilled to a depth of 23 ft-bgs to vertically delineate the extent of DRO contamination. This borehole was selected for vertical delineation because the previous sampling event showed that this borehole had a DRO exceedance of 2,600 mg/kg at 7-ft-bgs."

Mr. Riege
Western Refining Gallup Refinery
December 11, 2008
Page 2

One borehole to a depth of 23 feet below ground surface is not representative of the entire area to be excavated (as shown in Figure 6) and cannot be used delineate the vertical extent of DRO contamination. Note, approximately four feet from borehole B8(B8-NEW-SE-S1) is borehole A(B8-NEW-SE) with a detected DRO concentration of 19,000 mg/kg at nine feet bgs. According to Figures 4 and 6, at borehole A(B8-NEW-SE), samples have not been collected below a depth of nine feet to determine the approximate maximum depth of contamination. Therefore, the Permittee has not fully delineated the vertical extent of DRO contamination. During the excavation, the Permittee must ensure the vertical and horizontal extent of contamination has been delineated. See Comments 2 and 3.

Comment 2

In Section 2.1.3 (Sample Results), page 2-3, the Permittee states that “[s]amples were submitted to the laboratory for analysis. The laboratory analyzed the samples using USEPA Method 8015B. The results for samples collected from new boreholes M-1, I-1, G-1, and K-1 at depths of 3, 8, and 13 bgs and existing borehole B8 (B8-NEW-SE-S1) at 8, 13, 18, and 23 ft-bgs were non-detect for DRO. Trihydro believes that this new data effectively delineates both the horizontal and vertical extent of DRO contamination associated with test pit B-8. These results are illustrated on Figure 4.”

Based on Figure 4, the Permittee has not defined the vertical extent of DRO contamination associated with test pit B-8 at locations B8-NE and A(B8-NEW-SE), which contain DRO concentrations of 1,300 mg/kg at three feet (ft) bgs and 19,000 mg/kg at nine ft bgs, respectively. These detections are above the NMED TPH guideline of 890 mg/kg. The Permittee must ensure that during the excavation, the contaminated soil associated with these locations is removed. The Permittee must also collect a representative number of confirmation samples to demonstrate that residual DRO contamination is below 890 mg/kg. Based on field events, confirmation samples must be collected from the bottom and side-walls of the excavation. See Comment 3.

Comment 3

The Permittee discusses confirmation sample collection in Section 4.3. The Permittee proposes to collect 10 confirmation samples which are identified in Figure 6. The Permittee states on page 4-2, that “[t]he area to be excavated to 13-ft-bgs has four sidewalls. However, four samples with DRO concentrations below the cleanup standard have already been collected from the sidewalls of this area (as the result of previous delineation activities.) Because of this, Trihydro believes that one additional sidewall confirmation sample collected from the area to be excavated to 13 ft-bgs will be sufficient to demonstrate that DRO contaminated soil has been removed from this area....[a] summary of the proposed soil confirmation sampling is presented in Table 1.”

NMED does not agree with the proposed confirmation sampling. The Permittee is asking NMED to approve a specific number of confirmation samples when field conditions may prove

Mr. Riege
Western Refining Gallup Refinery
December 11, 2008
Page 3

otherwise. Additional confirmation bottom and side-wall samples may be necessary to demonstrate compliance. NMED has the following comments related to the remedial activities:

- a. There are data gaps in the delineation of the vertical and horizontal extent of DRO contamination. For example, in reference to Figure 6, sample points K, H, I, and M were sampled at depths of three and five feet. These locations have DRO detections above the cleanup standard at three feet and detections below the cleanup standards at five feet. The Permittee has not demonstrated that between three and five feet, the DRO concentrations in the soil are below the cleanup standard of 890 mg/kg or whether additional soil must be removed between these depths. In addition, there is approximately 20 feet between locations J, K, G, H, I, and M and K-1, G-1, I-1, and M-1. With the exception of location L, there are no sampling locations or analytical data to demonstrate if DRO is present in soil at concentrations greater than the cleanup level within this 20 foot gap. (See items b-e)
- b. The area to be excavated to 13 feet may require additional bottom and side-wall confirmation samples than what was proposed in the Work Plan in order to demonstrate that residual soil DRO concentrations are below the clean up standard. This shall be determined by the Permittee based on field observations.
- c. Sample locations E, K, H, I, and M are all near the limits of the excavation between depths of three and five feet (as shown in Figure 6). Contamination is present at concentrations that exceed the cleanup standard at three feet at all of these locations. It is not clear if soils will be excavated to five feet or three feet at these locations. The Permittee must ensure that all of the contaminated soil is removed and that a representative number of confirmation samples are collected from the bottom and side-walls of the excavation to demonstrate successful removal.
- d. The Permittee must collect additional confirmation samples from the following locations: between CS-8 and M-1, between I-1 and M-1, and between 8-8NEW-NW and J. Confirmation samples must be collected from the bottom of the excavation. Side-wall confirmation samples must also be collected pending observations based on field screening. Side-wall samples must be collected to demonstrate that all soil containing DRO contamination at levels greater than the cleanup standard has been removed. NMED has provided an attached Figure (6) that identifies the additional locations for confirmation sample collection (locations are marked in red with a circled X). The Permittee may need to collect additional confirmation samples based on field observations.

Mr. Riege
Western Refining Gallup Refinery
December 11, 2008
Page 4

- e. The Permittee must use field screening methods to determine if additional excavation and confirmation sampling are necessary. Depending on field observations, it may be necessary to collect additional side-wall samples in addition to bottom samples (e.g., if contamination is found where it was not expected, excavation side-wall and bottom confirmation samples must be collected to demonstrate that contaminated soils have been removed).

Comment 4

In Section 4.2 (Excavation), page 4-1, the Permittee states “[u]pon completion of the excavation and receipt of sample results that verify that DRO concentrations are below the cleanup standard, the area will be backfilled with clean native material obtained from within the Refinery boundary.”

The Permittee must demonstrate that the native material used as backfill has not been contaminated from refinery operations.

Comment 5

In Section 6.1 (Photographs), page 6-1, the Permittee states “[p]hotographs will be used to substantiate and augment the field notes. Photo-documentation will be utilized to show that the staked boundaries have been excavated to the appropriate depths. Each photograph will be numbered and recorded on a photograph log.”

If the Permittee provides photographic documentation in the investigation report, the photographs must include the direction from which the photograph was taken (e.g., facing east).

Comment 6

The Permittee provides the following notation under “Explanation” in Figures 4 and 6 that states “* A(B8-NEW-SE) = MAY EVENT(AUGUST EVENT)” and “* B(B8-NEW-SE-S1) = MAY EVENT(AUGUST EVENT).”

If these notations are depicted on the figures in the final report, the Permittee must explain their meaning.

Comment 7

In accordance with NMED’s July 22, 2008 Notice of Disapproval, the Permittee was supposed to submit an electronic copy of the Revised Excavation Plan with all edits and modifications shown in redline-strikeout format.

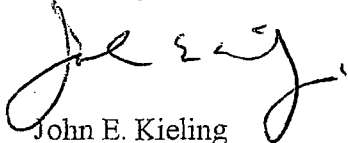

Mr. Riege
Western Refining Gallup Refinery
December 11, 2008
Page 5

A redline -strikeout copy of the Revised Excavation Plan was not provided. In the future the Permittee must ensure that all requested information is submitted, or provide a reason for not including the requested information.

The Permittee must adhere to all requirements established within the Approval with Direction. The Work Plan must be implemented no later than April 1, 2009 and the Remedy Completion Report must be submitted to NMED no later than July 1, 2009. The Permittee must notify NMED one week prior to the start of field activities. No response to this letter is necessary.

If you have any questions regarding this letter please contact Hope Monzeglio of my staff at (505) 476-6045.

Western Refining, Southwest Inc., Gallup Refinery
Route 3, Box 7
Gallup, New Mexico 87301

RE: NOTICE OF DISAPPROVAL
RAILROAD RACK LAGOON OVERFLOW DITCH AND FAN-OUT AREA,
SWMU No. 8 SUBSURFACE INVESTIGATION FINAL REPORT
WESTERN REFINING COMPANY SOUTHWEST, INC., GALLUP REFINERY
EPA ID # NMD000333211
HWB-WRG-10-002

Dear Mr. Riege:

The New Mexico Environment Department (NMED) reviewed the *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8, Subsurface Investigation Final Report* (Report), dated January 2010, submitted on behalf of Western Refining Company Southwest Inc., Gallup Refinery (Permittee) and hereby issues this Notice of Disapproval (NOD) with the following comments.

Comment 1

NMED's December 11, 2009 *Approval with Modifications*, required the Permittee to define the vertical and horizontal extent of contamination at the overflow and fan-out area. From the Report, it is not clear that the Permittee completed the task to define the vertical extent of contamination. Table 1 (DRO Analytical Data Summary) lists results that are above the Total Petroleum Hydrocarbon (TPH) Diesel Range Organics (DRO) cleanup level of 890 mg/kg. Figure 5 (Railroad Rack Lagoon Overflow Ditch B-8 Excavation Areas and DRO Results)

presents sample results and areas that were excavated, but it does not appear that confirmation samples were collected at the bottom of the excavation. The excavation bottom samples were required by NMED's March 14, 2009 letter *Approval with Direction* which stated "[i]f the excavation does not exceed three feet below ground surface (bgs), the Permittee may collect confirmation samples from the bottom of the excavations only. If the excavation exceeds three feet bgs, then confirmation samples must be collected from all sidewalls of the excavations in addition to from the base of the excavations." The Permittee did not follow this directive, for example, in Area 3, which was excavated to seven feet; confirmation samples were not collected from the base of this excavation. In Area 4, which was excavated to 13 feet, the Permittee collected six samples around the perimeter of the excavation at a depth of 13 feet and only three samples were collected from the base of the excavation. At one point (A (B8-NEW-SE)) there is an increase in DRO concentration with depth and apparently no sample collected to demonstrate that the DRO-contaminated soil was removed.

In order to determine whether or not the removal of all soils containing concentrations of DRO above 890 mg/kg from the fan-out area was completed, the Permittee needed to collect samples from the base and sidewalls of the excavation. Therefore, confirmation samples must be collected at the excavation bottom and from the sidewalls using a systematic sampling pattern and samples must also be collected from areas of visible staining, elevated moisture levels, and contaminated zones identified by field-screening and beneath areas with detected residual contamination. Until the Permittee defines the extent of the contamination, NMED cannot determine if further remediation is necessary. The Permittee must conduct additional confirmation sampling and, if necessary, conduct additional excavation activities if the confirmation samples contain DRO concentrations greater than the acceptable cleanup level. In the revised Report, the Permittee must submit a figure depicting the locations of the final confirmation sample locations, depths the samples were taken, and the analytical results. The Permittee must submit proposed confirmation sample locations for NMED approval no less than 30 days before confirmation sampling activities begin.

Comment 2

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states "[c]onfirmation sample locations were strategically located to supplement the existing DRO data." The Permittee must include more detail regarding the confirmation sampling (i.e., provide the rationale for the "strategic" location of the confirmation samples). The Permittee must revise the Report to include specific details regarding the confirmation sampling locations and the logic behind the selection of the sampling locations.

Comment 3

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states "[d]ue to

Ed Riege
Gallup Refinery
May 12, 2010
Page 3

confirmation sample DRO exceedences, the size of the excavation, as proposed in the 2008 Excavation Work Plan, was increased ... Excavation activities continued through October 2009 due to additional confirmation sample exceedences and visually impacted soil." The Permittee must revise the Report to include additional detail regarding the excavation. For example, the Permittee must state, or include a figure with, the locations where the exceedences were found (e.g., sample location, depth, cardinal direction), discuss the amount of soil removed during each of the excavations, and describe confirmation sampling.

Comment 4

In Section 3.2 (Excavation Activities), page 3-2 and 3-3, the Permittee states "Test Pit B-8 confirmation sample locations and results are illustrated in Figure 5. Area 1 was excavated to depth of 3 feet below ground surface (ft bgs), and excavation activities in this area were overseen by Trihydro. Area 2 was excavated to a depth of 5 ft bgs by Gallup personnel. Area 3 and 4 excavations were overseen by a combination of Trihydro and Gallup personnel and extended to 7 and 13 ft bgs." The Permittee must revise the Report to discuss the basis for excavation to the various depths (e.g., the confirmation sample detections that indicated the need for additional soil removal). The Permittee must revise Figure 5 or provide an additional figure to show the final confirmation sample locations, see Comment 1.

Comment 5

In Section 4.3.1.1 (Delineation Sample Locations), page 4-2, paragraph 2, the Permittee states "[t]he sampling locations in these three delineation sampling events (May, August, and December 2007) were determined based on exceedences identified during the preceding sampling events. These locations are illustrated on Figures 5 and 6." The Permittee must list these sampling locations by name in the text, so that the locations can be identified in the figures. Additionally, Figure 5 appears to illustrate the locations of multiple sampling events beyond the three delineation events mentioned above. The Permittee must revise the Report to refer to specific sampling locations, instead of referring to the locations generally.

Comment 6

In Section 4.3.2.1 (Confirmation Sample Locations), page 4-4, paragraph 1, the Permittee states "[a] total of ten sidewall and base confirmation sample locations were proposed in the 2008 Excavation Work Plan. Three additional locations were added at the suggestion of NMED in the December 11, 2008 Approval with Direction letter provided as Appendix F. These 13 locations were strategically located in areas where DRO delineation data was limited in an attempt to fill potential data gaps. Of the 13 approved confirmation sampling locations, 3 exceeded the DRO cleanup standard prompting expansion of the excavation." The Permittee must revise the Report to be specific regarding the sample location names (e.g., instead of stating "of the 13 approved

Ed Riege
Gallup Refinery
May 12, 2010
Page 4

sampling locations, 3 exceeded," list the specific location designations).

Comment 7

In Section 4.4 (Investigation Derived Waste), page 4-5, the Permittee states "[e]xcavated soils and soil cuttings produced during the sampling events have been transported to Gallup's Land Farm as permitted by OCD." The Permittee must revise the Report to describe the estimated volume of soil cuttings and excavated soil that were disposed of at the Land Farm.

Comment 8

In Section 6.1 (Test Pit B-9), the Permittee states "samples collected from each corner of the excavation at depths of 3 ft bgs and the center of the excavation at a depth of 5 ft bgs showed DRO concentrations below the clean up standard." The sample points are illustrated in Figure 6 (Railroad Rack Lagoon Overflow Ditch B-9 Final Excavation Area and Sample Results); the Permittee excavated the ditch to 5 feet, but in the figure it is not apparent that the 3 ft samples are sidewall samples. The Permittee must revise the Report and Figures to differentiate between sidewall and bottom confirmation samples (e.g., use different symbols or colors on the figures, provide additional figures or in a table cross-referenced in the figure key).

Comment 9

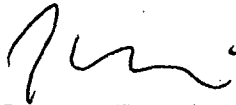

In Section 6.2 (Test Pit B-8), the Permittee states "[a]s illustrated on Figure 5, between delineation and confirmation sampling activities, a total of 67 soil samples showing DRO concentrations below the cleanup standard have been excavated from the vicinity of Test Pit B-8. A summary of the analytical data is provided as Table 1." Figure 5 and Table 1 appear to show either residual contamination, or that the Permittee did not collect confirmation samples from the base of the excavation. See Comment 1 regarding Figure 5, Table 1 and additional confirmation sampling requirements.

Ed Riege
Gallup Refinery
May 12, 2010
Page 5

The Permittee must address all comments contained in this NOD and submit a revised Work Plan to NMED and OCD on or before July 20, 2010. The revised Report must be accompanied by a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. In addition, the Permittees must submit a redline-strikeout version that includes all changes and edits to the Report (electronic copy) with the response to this NOD.

If you have questions regarding this NOD please contact Kristen Van Horn of my staff at 505-476-6046.

Sincerely,

James P. Bearzi

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: December 2007 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: December 17, 2007
Date Validated: June 18, 2009	Sample End Date: December 17, 2007
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0712257	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of matrix spike (MS) and matrix spike duplicate (MSD) samples, and of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Additionally, field accuracy was established by collecting an equipment blank to monitor for possible ambient or cross contamination during sampling. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ⊗ Matrix Spike/Matrix Spike Duplicates (MS/MSD)
- ✓ Field Duplicates
- ✓ Equipment Blank

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were qualified as a result of this validation for a high MS/MSD RPD value.

Data qualifiers used during this validation included:

UJ – Estimated reporting limit

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	No
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. R – RPD outside accepted recovery limits.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions were not applied to the samples.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 3.0°C, as noted in the Sample Receipt Checklist. Custody seals were present and intact on both the sample bottles and the shipping container.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time. The laboratory checked on the Sample Receipt Checklist that samples were not received within holding time. Holding times were evaluated and found to be acceptable. No further action was required.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix. The equipment blanks were reported in mg/L which is acceptable for the water matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	

VALIDATION CRITERIA CHECKLIST

13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were prepared on a greater than 5% basis with the exceptions of DRO batch 14706. The LCS/LCSD data was used to validate this batch. The MS/MSD sample pair for DRO batch 14687 was prepared from sample B8_12_17_G1_3 and the MS/MSD sample pair for DRO batch 14696 was prepared from sample B8_12_17_K1_8.	
14. Were matrix spike recoveries within laboratory-specified limits?	No
Comments: The MS and MSD recoveries for target analytes were within laboratory-specified limits with the following exception. The MS/MSD RPD value for DRO in batch 14696 was above the acceptable limit of 17.4% at 25.6%. As a result of possible poor repeatability, the analytes DRO and MRO were qualified as UJ in the associated samples for non-detects.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis.	
16. Were laboratory control recoveries within laboratory-specified limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: One equipment blank (EB_12_17_07) was submitted with this data set which is less than 10% the total number of samples.	
19. Were detections found in trip blanks, equipment blanks, or field blanks?	No
Comments: There were no detections in the equipment blank.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: One field duplicate, BD_12_17_07 was collected as a duplicate of sample B8_12_17_I1_3, which is less than 10% the total number of samples.	
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	N/A
Comments: Field duplicate RPD values could not be calculated since both the parent and duplicate samples were non-detected for target analytes.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.	

DATA QUALIFICATION SUMMARY

Analyte	Client Sample ID	Laboratory Assigned ID	Laboratory Result (mg/kg)	Reviewer Qualifier	Reason for Qualification
DRO	B8_12_17_I1_3	0712257-08	ND (10)	UJ	The RPD for the MS/MSD or LCS/LCSD was greater than the acceptable difference indicating poor repeatability.
MRO	B8_12_17_I1_3	0712257-08	ND (50)	UJ	The RPD for the MS/MSD or LCS/LCSD was greater than the acceptable difference indicating poor repeatability.
DRO	B8_12_17_I1_8	0712257-09	ND (10)	UJ	The RPD for the MS/MSD or LCS/LCSD was greater than the acceptable difference indicating poor repeatability.
MRO	B8_12_17_I1_8	0712257-09	ND (50)	UJ	The RPD for the MS/MSD or LCS/LCSD was greater than the acceptable difference indicating poor repeatability.
DRO	B8_12_17_I1_1_3	0712257-10	ND (10)	UJ	The RPD for the MS/MSD or LCS/LCSD was greater than the acceptable difference indicating poor repeatability.

RE: Excavation Fan Out Area

Order No.: 0903342

Dear Gaurav Rajen:

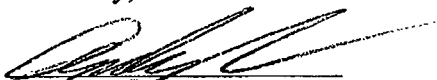

Hall Environmental Analysis Laboratory, Inc. received 14 sample(s) on 3/20/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: March 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: March 17, 2009
Date Validated: June 19, 2009	Sample End Date: March 18, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0903342	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Accuracy, method compliance, and completeness of this data package were assessed during this data review. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Additionally, field accuracy was established by collecting equipment blanks to monitor for possible ambient or cross contamination during sampling. Method compliance was established by reviewing holding times, detection limits, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999.

Tier II Data Validation Report Summary

SAMPLE NUMBERS TABLE

EB1-031809	0903342-15

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ✓ Equipment Blanks

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified during this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: The laboratory noted the following non-conformance with this data set. For Method 8015 DRO, samples CS-2 and CS-4, the surrogate DNOP was not recovered due to dilution.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Spike recovery outside accepted recovery limits.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions of 20 times were applied to samples CS-2 and CS-4 for DRO analysis. The final usability of the data with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 6.0°C, as noted in the Sample Receipt Checklist.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix. The equipment blanks were reported in mg/L which is acceptable for the water matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested. A MS/MSD sample was collected and not used as a matrix spike. Discussions with the laboratory determined that this was acceptable and required no further action.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	

VALIDATION CRITERIA CHECKLIST

13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set although the COC listed a matrix spike sample collected for sample CS-2. The laboratory was contacted and stated that the sample concentration was too high and the spike would be un-recoverable and therefore the matrix spike was not performed. No further action was required.	
14. Were matrix spike recoveries within laboratory-specified limits?	N/A
Comments: Matrix spike samples were not prepared for this data set.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis.	
16. Were laboratory control recoveries within laboratory-specified limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits. The surrogate DNOP for samples CS-2 and CS-4 was not recovered due to dilution. This is acceptable per the method.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: Eight equipment blanks (EB2-031809, EB1-031809-3, EB2-031809-3, EB1-031809-2, EB2-031709, EB2-031809-2, EB1-031709, and EB1-031809) were submitted with this data set which is greater than 10% the total number of samples.	
19. Were detections found in trip blanks, equipment blanks, or field blanks?	No
Comments: There were no detections in the equipment blank.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: Field duplicates were not collected with this data set.	
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	N/A
Comments: Field duplicates were not collected with this data set.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.	

COVER LETTER

Monday, June 22, 2009

Gaurav Rajen
Western Refining Southwest, Gallup

TEL: (505) 722-0227

FAX: (505) 722-0210

RE: Excavation Fan out area

Order No.: 0904327

Dear Gaurav Rajen:

Hall Environmental Analysis Laboratory, Inc. received 8 sample(s) on 4/21/2009 for the analyses presented in the following report.

This report is an addendum to the report dated April 24, 2009. The analysis date for DRO has been corrected.

No determination of compounds below these (denoted by the ND or < sign) has been made. Please don't hesitate to contact Hall Environmental for any additional information or clarifications.

Reporting limits are determined by EPA methodology.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read 'Andy Freeman', is written over a horizontal line.

Andy Freeman, Business Manager

Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: April 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: April 21, 2009
Date Validated: June 19, 2009	Sample End Date: April 21, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0904327	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of matrix spike (MS) and matrix spike duplicate (MSD) samples, and of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Additionally, field accuracy was established by collecting equipment blanks to monitor for possible ambient or cross contamination during sampling. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

SAMPLE NUMBERS TABLE

1EB042109-1	0904327-04
2EB042109-1	0904327-05
CS-14	0904327-06
1EB042109-2	0904327-07
2EB042109-2	0904327-08

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ⊗ Matrix Spike/Matrix Spike Duplicates (MS/MSD)
- ✓ Field Duplicates
- ✓ Equipment Blanks

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were qualified as a result of this validation for extreme matrix interference.

Data qualifiers used during this validation included:

- J – Estimated concentration
- UJ – Estimated reporting limit

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: The laboratory re-issued the laboratory report to correct the analysis date for DRO on June 22, 2009.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Spike recovery outside accepted recovery limits.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions of 10 times were applied to samples BD042109, CS-15, and CS-8 for DRO analyses. The final usability of the data with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 5.0°C, as noted in the Sample Receipt Checklist.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix. The equipment blanks were reported in mg/L which is acceptable for the water matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were prepared on a greater than 5% basis with the exceptions of DRO batch 18911. The LCS/LCSD data was used to validate this batch. The MS/MSD sample pair for DRO batch 18909 was prepared from sample CS-15.	

VALIDATION CRITERIA CHECKLIST	
14. Were matrix spike recoveries within laboratory-specified limits?	No
Comments: The MS and MSD recoveries for target analytes were within laboratory-specified limits with the following exceptions. The MS and MSD for DRO in batch 18909 were below the acceptable limits of 67.4% to 117% at -2070 and -2260%, respectively. As a result of severe matrix interference, the samples were qualified as J for detections and UJ for non-detects for the analytes DRO and MRO.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis.	
16. Were laboratory control recoveries within laboratory-specified limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: Four equipment blanks (1EB042109-1, 2EB042109-1, 1EB042109-2, and 2EB042109-2) were submitted with this data set which is at least 10% the total number of samples.	
19. Were detections found in trip blanks, equipment blanks, or field blanks?	No
Comments: There were no detections in the equipment blanks.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: One field duplicate, BD042109 was collected as a duplicate of sample CS-8 which is at least 10% the total number of samples.	
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	Yes
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples as shown in the Field Duplicate Summary table at the end of this report.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.

FIELD DUPLICATE SUMMARY

Client Sample ID: CS-8 Field Duplicate Sample ID: BD042109			
Analyte	Laboratory Result	Duplicate Result	Relative Percent Difference (RPD)
DRO	6100 mg/kg	5500 mg/kg	10.3%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.			

COVER LETTER

Wednesday, April 29, 2009

Gaurav Rajen

FAX (505) 722-0210

RE: Excavation Fan Out Area

Order No.: 0904388

Dear Gaurav Rajen:

Hall Environmental Analysis Laboratory, Inc. received 19 sample(s) on 4/24/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: April 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: April 21, 2009
Date Validated: June 22, 2009	Sample End Date: April 23, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0904388	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Additionally, field accuracy was established by collecting equipment blanks to monitor for possible ambient or cross contamination during sampling. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Tier II Data Validation Report Summary

1EB042309	0904388-18
2EB042309	0904388-19

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ✓ Field Duplicates
- ✓ Equipment Blanks

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified as a result of this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST	
1. Did the laboratory identify any non-conformances related to the analytical data?	No
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags used by the laboratory? If yes, define.	No
Comments: The laboratory did not use data qualification flags with this data set.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions of 10 times were applied to samples CS-19 and BD for DRO analyses. The final usability of the data with respect to dilutions will be determined by the project manager.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 6.0°C, as noted in the Sample Receipt Checklist. Custody seals were present and intact on the sample bottles.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix. The equipment blanks were reported in mg/L which is acceptable for the water matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested. A MS/MSD sample was collected and not used as a matrix spike. Discussions with the laboratory determined that this was acceptable and required no further action.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set even though a MS/MSD sample was submitted. The laboratory was contacted and stated that the sample concentration was too high and the spike would be unrecoverable and therefore the matrix spike was not performed. No further action was required.	

VALIDATION CRITERIA CHECKLIST		
14. Were matrix spike recoveries within laboratory-specified limits?	N/A	
Comments: Matrix spike samples were not prepared for this data set.		
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes	
Comments: Laboratory control samples were reported on a greater than 5% basis.		
16. Were laboratory control recoveries within laboratory-specified limits?	Yes	
Comments: Laboratory control recoveries were within laboratory-specified limits.		
17. Were surrogate recoveries within laboratory control limits?	Yes	
Comments: Surrogate recoveries were within laboratory control limits.		
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes	
Comments: Four equipment blanks (1EB042209, 2EB042209, 1EB042309, and 2EB042309) were submitted with this data set which is at least 10% the total number of samples.		
19. Were detections found in trip blanks, equipment blanks, or field blanks?	No	
Comments: There were no detections in the equipment blanks.		
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No	
Comments: One field duplicate, BD was collected as a duplicate of sample CS-19 which is less than 10% the total number of samples.		
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	Yes	
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples as shown in the Field Duplicate Summary table at the end of this report.		
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A	
Comments: Laboratory duplicates were not prepared for this data set.		

FIELD DUPLICATE SUMMARY

Client Sample ID: CS-19 Field Duplicate Sample ID: BD			
Analyte	Laboratory Result	Duplicate Result	Relative Percent Difference (RPD)
DRO	1600 mg/kg	1700 mg/kg	6.1%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.			

COVER LETTER

Friday, May 22, 2009

Gaurav Rajen

RE: Excavation Fan Out Area

Order No.: 0905343

Dear Gaurav Rajen:

Hall Environmental Analysis Laboratory, Inc. received 4 sample(s) on 5/19/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

A handwritten signature in black ink, appearing to read 'Andy Freeman', written over a horizontal line.

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: May 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: May 19, 2009
Date Validated: June 22, 2009	Sample End Date: May 19, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0905343	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ✓ Field Duplicates

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were not qualified as a result of this validation.

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST

1. Did the laboratory identify any non-conformances related to the analytical data?	Yes
Comments: The laboratory noted in the case narrative that the S flag denotes that the surrogate was not recoverable due to sample dilution or matrix interferences.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Surrogate not recoverable due to sample dilution or matrix interference	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions of 10 to 20 times were applied to the samples for DRO analyses. The final usability of data with respect to dilutions will be determined by the project team.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were within the 4°C +/- 2°C acceptable range at 4.9°C, as noted in the Sample Receipt Checklist. Custody seals were present and intact on the sample bottles.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested. A MS/MSD sample was collected and not used as a matrix spike. Discussions with the laboratory determined that this was acceptable and required no further action.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	

VALIDATION CRITERIA CHECKLIST	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	No
Comments: Matrix spike samples were not prepared for this data set even though a MS/MSD sample was submitted. The laboratory was contacted and stated that the sample concentration was too high and the spike would be unrecoverable and therefore the matrix spike was not performed. No further action was required.	
14. Were matrix spike recoveries within laboratory-specified limits?	N/A
Comments: Matrix spike samples were not prepared for this data set.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis.	
16. Were laboratory control recoveries within laboratory-specified limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits. The surrogate DNOP was not reportable in samples CS-20 and MS/MSD CS-20. This is acceptable per the method.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No
Comments: Blank samples were not submitted with this data set.	
19. Were detections found in trip blanks, equipment blanks, or field blanks?	N/A
Comments: Blank samples were not submitted with this data set.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: One field duplicate, BD051909 was collected as a duplicate of sample CS-21 which is at least 10% the total number of samples.	
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	Yes
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples as shown in the Field Duplicate Summary table at the end of this report.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.	

FIELD DUPLICATE SUMMARY

Client Sample ID: CS-21 Field Duplicate Sample ID: BD051919			
Analyte	Laboratory Result	Duplicate Result	Relative Percent Difference (RPD)
DRO	3000 mg/kg	2100 mg/kg	35.3%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.			

COVER LETTER

Monday, June 08, 2009

Gaurav Rajen

RE: Excavation Fan Out Area

Order No.: 0906074

Dear Gaurav Rajen:

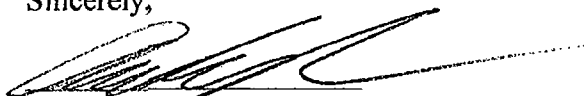

Hall Environmental Analysis Laboratory, Inc. received 4 sample(s) on 6/4/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: June 2009 Sampling Event	Sample Matrix: Soil
Project Number: 697-017-002	Sample Start Date: June 3, 2009
Date Validated: June 22, 2009	Sample End Date: June 3, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0906074	
Data Validator's Name: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of matrix spike (MS) and matrix spike duplicate (MSD) samples, and of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
CS-24	0906074-01
CS-23	0906074-02
CS-22	0906074-03
BD	0906074-04

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ⊗ Matrix Spike/Matrix Spike Duplicates (MS/MSD)
- ✓ Field Duplicates

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were qualified as a result of this validation for low matrix spike recoveries.

Data qualifiers used during this validation included:

- J – Estimated concentration
- UJ – Estimated reporting limit

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST

1. Did the laboratory identify any non-conformances related to the analytical data?	No
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Spike recovery outside accepted recovery limits.	
3. Were sample chain-of-custody forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions were not applied to the samples in this data set.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were below the 4°C +/- 2°C acceptable range at 1.0°C, as noted in the Sample Receipt Checklist. The cooler temperature below 2°C was judged as acceptable since the samples were not reported to be frozen upon receipt at the laboratory and the sample containers were reported to be intact.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	
12. Were method blank detections reported for this data set?	No
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Matrix spike samples were prepared on a greater than 5% basis. The MS/MSD sample pairs for DRO batch 19269 were prepared from sample CS-22.	

Trihydro

VALIDATION CRITERIA CHECKLIST		
14. Were matrix spike recoveries within laboratory-specified limits?	No	
Comments: The MS and MSD recoveries for target analytes were within laboratory-specified limits with the following exceptions. The MS and MSD for DRO in batch 19269 were outside the acceptable limits of 67.4% to 117% at -76.9% and -75.2%, respectively. As a result of severe matrix interference, the samples were qualified as J for detections and UJ for non-detects for both DRO and MRO.		
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes	
Comments: Laboratory control samples were reported on a greater than 5% basis.		
16. Were laboratory control recoveries within laboratory-specified limits?	Yes	
Comments: Laboratory control recoveries were within laboratory-specified limits.		
17. Were surrogate recoveries within laboratory control limits?	Yes	
Comments: Surrogate recoveries were within laboratory control limits.		
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	No	
Comments: Blank samples were not submitted with this data set.		
19. Were detections found in trip blanks, equipment blanks, or field blanks?	N/A	
Comments: Blank samples were not submitted with this data set.		
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes	
Comments: One field duplicate, BD was collected as a duplicate of sample CS-23 which is at least 10% the total number of samples.		
21. Were field duplicate RPD values less than the upper RPD limit (soil [50%], water [30%], or air/vapor [25%]), as specified by the laboratory or method?	N/A	
Comments: Field duplicate RPD values could not be calculated since both samples were non-detect for the requested analytes.		
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A	
Comments: Laboratory duplicates were not prepared for this data set.		

DATA QUALIFICATION SUMMARY

Analyte	Field Sample ID	Lab Sample ID	Result (mg/kg)	Reviewer Qualifier	Reviewer Qualifier Reason
DRO	CS-24	0906074-01	ND (10)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-24	0906074-01	ND (50)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
DRO	CS-23	0906074-02	ND (10)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-23	0906074-02	ND (50)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.

RE: Excavation Fan Out Area

Order No.: 0907447

Dear Gaurav Rajen:

Hall Environmental Analysis Laboratory, Inc. received 7 sample(s) on 7/24/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

for Andy Freeman, Business Manager
Nancy McDuffie, Laboratory Manager

Tier II Data Validation Report Summary

Client: Western Refining Company, Gallup	Laboratory: Hall Environmental Analysis Laboratory, Inc.
Project Name: July 2009 Sampling Event	Sample Matrix: Soil and Water
Project Number: 697-017-002	Sample Start Date: July 23, 2009
Date Validated: December 18, 2009	Sample End Date: July 23, 2009
Parameters Included: Diesel Range Organics (DRO) and Motor Oil Range Organics (MRO) by Environmental Protection Agency (EPA) Method 8015B	
Laboratory Project IDs: 0907447	
Data Validator: Jessica Swanson, Environmental Chemist	

DATA EVALUATION CRITERIA SUMMARY

A Tier II Data Validation was performed by Trihydro Corporation's Chemical Data Evaluation Services group on the analytical data report package generated by Hall Environmental Analysis Laboratory, Inc. evaluating samples from the Western Refining Company site located in Gallup, New Mexico.

Precision, accuracy, method compliance, and completeness of this data package were assessed during this data review. Precision was determined by evaluating the calculated relative percent difference (RPD) values of samples from field duplicate pairs and laboratory duplicate pairs. Laboratory accuracy was established by reviewing the demonstrated percent recoveries of matrix spike (MS) and matrix spike duplicate (MSD) samples, and of laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) to verify that none of the data were biased. Method compliance was established by reviewing holding times, detection limits, surrogate recoveries, method blanks, and the LCS and LCSD percent recoveries against method specific requirements. Completeness was evaluated by determining the overall ratio of the number of samples planned versus the number of samples with valid analyses. Determination of completeness included a review of the chain-of-custody, laboratory analytical methods, and any other necessary documents associated with this analytical data set.

Data were evaluated in general accordance with validation criteria set forth in the USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review, document number USEPA-540-R-08-01, June 2008 with additional reference to USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review, document number EPA 540/R-99-008 of October 1999. Review of duplicates is conducted in accordance with USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.

SAMPLE NUMBERS TABLE

Client Sample ID	Laboratory Sample Number
CS-25	0907447-01
CS-26	0907447-02
BD-072309	0907447-03
CS-27	0907447-04
CS-28	0907447-05
Rinsate-1	0907447-07
Rinsate-2	0907447-08

Tier II Data Validation Report

The samples were analyzed for client-specified analytes. Chain-of-custody (COC) completeness is included in Section #3. The laboratory data were reviewed to evaluate compliance with the required methods and the quality of the reported data. A leading check mark (✓) indicates that the referenced data were deemed acceptable. A preceding crossed circle (⊗) signifies problems with the referenced data that may have warranted attaching qualifiers to the data.

- ✓ Data Completeness
- ✓ COC Documentation
- ✓ Holding Times and Preservation
- ✓ Laboratory Blanks
- ✓ System Monitoring Compounds (i.e. Surrogates)
- ✓ Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)
- ⊗ Matrix Spike/Matrix Spike Duplicates (MS/MSD)
- ✓ Field Duplicates
- ✓ Equipment Blanks

OVERALL DATA PACKAGE ASSESSMENT

Based on a data validation review, the data are acceptable as delivered. Data qualified by the laboratory are discussed in Section #2.

The purpose of validating data and assigning qualifiers is to assist in proper data interpretation. Data which are not qualified meet the site data quality objectives. If values are assigned qualifiers other than an R, the data may be used for site evaluation, with the reasons for qualification being given consideration when interpreting sample concentrations. Data points which are assigned an R qualifier should not be used for any site evaluation purposes. Data were qualified as a result of this validation due to a low matrix spike recovery and a high MS/MSD RPD value.

Data qualifiers used during this validation included:

- J – Estimated concentration
- UJ – Estimated reporting limit

Data Completeness

The analyses appeared to be performed as requested on the chain-of-custody records. The associated samples were received by the laboratory and appeared to be analyzed properly. No data points were rejected. The data completeness measure for this data package is 100%.

VALIDATION CRITERIA CHECKLIST

1. Was the report free of any non-conformances related to the analytical data identified by the laboratory?	Yes
Comments: The laboratory did not identify any non-conformances related to this data set.	
2. Were data qualification flags or any other notes used by the laboratory? If yes, define.	Yes
Comments: The laboratory used the following data qualification flag with this data set. S – Spike recovery outside accepted recovery limits. R – RPD outside accepted recovery limits. S – Surrogate was not recoverable due to sample dilution or matrix interferences.	
3. Were sample COC forms complete?	Yes
Comments: The COC records from field to laboratory were complete, and custody was maintained as evidenced by field and laboratory personnel signatures, dates, and times of receipt.	
4. Were detection limits in accordance with the QAPP, permit, or method, or indicated as acceptable by the Tier I validator?	Yes
Comments: Detection limits were reviewed and appeared to be acceptable. Dilutions up to 20 times were applied to the samples in this data set. The final usability of the data with respect to dilutions will be determined by the project manager.	
5. Were the requested analytical methods in compliance with the QAPP, permit, or COC?	Yes
Comments: The requested analytical methods were in compliance with what was requested on the COC.	
6. Were samples received in good condition within method specified requirements?	Yes
Comments: Samples were received intact and in good condition. Cooler temperatures were below the 4°C +/- 2°C acceptable range at 1.6°C, as noted in the Sample Receipt Checklist. The cooler temperature below 2°C was judged as acceptable since the samples were not reported to be frozen upon receipt at the laboratory and the sample containers were reported to be intact.	
7. Were samples analyzed within method specified or technical holding times?	Yes
Comments: Samples were analyzed within the acceptable hold time.	
8. Were reported units appropriate for the associated sample matrix/matrices and method(s) of analyses?	Yes
Comments: Analyte concentrations were reported in units of mg/kg. The reported units are acceptable for the soil matrix. The results for the rinsate samples were reported in units of mg/L, which are appropriate for water samples.	
9. Do the laboratory reports include all constituents requested to be reported as indicated by the Tier I validator?	Yes
Comments: As indicated on the Tier I data validation, laboratory reported constituents were in accordance with those requested.	
10. Was there indication from the laboratory that the initial or continued calibration verification results were within acceptable limits?	N/A
Comments: Initial and continuing calibration data were not included as part of this data set; however, these data are assumed to be acceptable as the laboratory did not note that any calibration verification results were outside acceptable limits.	
11. Was the total number of method blank samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Method blanks were prepared on a greater than 5% basis.	

VALIDATION CRITERIA CHECKLIST	
12. Were method blank samples free of analyte contamination?	Yes
Comments: Method blank detections were not reported for this data set.	
13. Was the total number of matrix spike samples prepared equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Matrix spike samples were prepared on a greater than 5% basis for the total number of samples. The MS/MSD sample pairs for DRO batch 19724 were prepared from sample CS-28.	
14. Were MS/MSD percent recoveries and MS/MSD RPD values within data validation or laboratory QC limits?	No
Comments: The MS and MSD recoveries for target analytes were within laboratory-specified limits with the following exceptions. Matrix spike samples were not prepared for motor oil analyses. However, the diesel range organics MS/MSD were used to evaluate the accuracy of the motor oil analyses. The MSD for DRO in batch 197247 was outside the acceptable limits of 67.4% to 117% at 48.8%. Additionally the MS/MSD RPD value was above the upper limit of 17.4% at 17.6%. Due to matrix interference and possible poor repeatability, the associated samples were qualified as J for detections and UJ for non-detects for both DRO and MRO.	
15. Was the total number of laboratory control samples analyzed equal to at least 5% of the total number of samples, or analyzed as required by the method?	Yes
Comments: Laboratory control samples were reported on a greater than 5% basis. Laboratory control samples were not prepared for motor oil analyses. However, the diesel range organics LCS/LCSD were used to evaluate the accuracy of the motor oil analyses.	
16. Were LCS/LCSD percent recoveries and LCS/LCSD RPD values within laboratory QC limits?	Yes
Comments: Laboratory control recoveries were within laboratory-specified limits.	
17. Were surrogate recoveries within laboratory control limits?	Yes
Comments: Surrogate recoveries were within laboratory control limits. The surrogates associated with samples CS-25, CS-26, BD-072309, and CS-27 were not recoverable due to sample dilution. This is acceptable per the method and required no further action.	
18. Was the number of equipment, trip, or field blanks collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: Field and trip blank samples were not submitted with this data set. The equipment blank samples Rinsate-1 and Rinsate-2 were submitted with the samples of this data set.	
19. Were the trip blank, field blank, and/or equipment blank samples free of analyte contamination?	Yes
Comments: There were not detections of the requested analytes in the Rinsate samples.	
20. Were the field duplicates collected equal to at least 10% of the total number of samples, or as required by the project guidelines, QAPP, SAP, or permit, or as indicated by the Tier I validator?	Yes
Comments: One field duplicate, BD-072309 was collected as a duplicate of sample CS-26 which is at least 10% the total number of samples.	
21. Were field duplicate RPD values within data validation QC limits (soil 0-50%, water 0-30%, or air 0-25%)?	Yes
Comments: Field duplicate RPD values were less than the upper RPD limit of 50% for soil samples as shown in the Field Duplicate Summary table at the end of this report.	
22. Were laboratory duplicate RPD values within laboratory-specified limits?	N/A
Comments: Laboratory duplicates were not prepared for this data set.	

DATA QUALIFICATION SUMMARY

Analyte	Field Sample ID	Lab Sample ID	Result (mg/kg)	Reviewer Qualifier	Reviewer Qualifier Reason
DRO	CS-25	0907447-01	6800	J	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-25	0907447-01	ND (1000)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
DRO	CS-26	0907447-02	17000	J	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-26	0907447-02	ND (1000)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
DRO	BD-072309	0907447-03	14000	J	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	BD-072309	0907447-03	ND (1000)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
DRO	CS-27	0907447-04	1800	J	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-27	0907447-04	ND (500)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
DRO	CS-28	0907447-05	110	J	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.
MRO	CS-28	0907447-05	ND (50)	UJ	The MS and/or MSD recovery(ies) were below the acceptable limits indicating possible matrix interference.

FIELD DUPLICATE SUMMARY

Client Sample ID: CS-26 Field Duplicate Sample ID: BD-072309			
Analyte	Laboratory Result (mg/kg)	Duplicate Result (mg/kg)	Relative Percent Difference (RPD)
DRO	17000	14000	19.4%
Field duplicate RPD control limits should not exceed 30% for water, 50% for soil, or 25% for air or vapor as established by USEPA Region 1 Laboratory Data Validation Function Guidelines for Evaluation of Organic Analysis, December 1996.			

COVER LETTER

Monday, October 19, 2009

Gaurav Rajen

RE: Excavation Fan Out Area

Order No.: 0910112

Dear Gaurav Rajen:

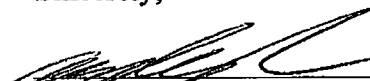

Hall Environmental Analysis Laboratory, Inc. received 6 sample(s) on 10/7/2009 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. Below is a list of our accreditations. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites.

Reporting limits are determined by EPA methodology. No determination of compounds below these (denoted by the ND or < sign) has been made.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman, Laboratory Manager

APPENDIX H

**WESTERN RESPONSE TO NMED NOTICE OF DISAPPROVAL
JUNE 2010**

Trihydro

June 23, 2010

Mr. James P. Bearzi
Chief – Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, NM 87505-6303

RE: NMED's "NOTICE OF DISAPPROVAL
RAILROAD RACK LAGOON OVERFLOW DITCH AND FAN-OUT AREA,
SWMU No. 8 SUBSURFACE INVESTIGATION FINAL REPORT
WESTERN REFINING COMPANY SOUTHWEST, INC., GALLUP REFINERY EPA
ID # NMD000333211
HWB-WRG-10-002"

Dear Mr. Bearzi:

The purpose of this letter is to respond to the New Mexico Environment Department's (NMED) comments to the *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8, Subsurface Investigation Final Report* (Report), dated January 6, 2010, submitted on behalf of Western Refining Company Southwest Inc., Gallup Refinery (Western). NMED issued comments to the Report in a *Notice of Disapproval*, dated May 12, 2010.

NMED's May 12 comments are repeated below for convenience. Each comment is followed by Western's response. NMED Comment 1 has been divided into subcomments so that each topic could be addressed separately.

NMED Comment 1

NMED's December 11, 2009 *Approval with Modifications*, required the Permittee to define the vertical and horizontal extent of contamination at the overflow and fan-out area. From the Report, it is not clear that the Permittee completed the task to define the vertical extent of contamination. Table 1 (DRO Analytical Data Summary) lists results that are above the Total Petroleum Hydrocarbon (TPH) Diesel Range Organics (DRO) cleanup level of 890 mg/kg.

Response to Comment 1

Table 1 of the Report lists all DRO data associated with the B-8 and B-9 excavations. These two locations were determined to be the only areas of concern based on the October 2006 investigation. In order to define the vertical and horizontal extent of

contamination, contaminated soil must be identified. Therefore, Western deemed it appropriate to show the results of the contaminated soil on Table 1 and Figure 5. When DRO exceedances were discovered, the excavation was expanded to remove the DRO contaminated soil and additional confirmation samples were collected. Table 2 (as subset of Table 1) has been created to show the confirmation samples collected at the base and sidewalls of the excavation. These samples have DRO concentrations below the cleanup level of 890 mg/kg, thus delineating the vertical and horizontal extent of contamination. Table 2 is included as an attachment to this correspondence and, upon NMED approval, will be included in a revised version of the Report.

NMED Comment 1 cont'd

Figure 5 (Railroad Rack Lagoon Overflow Ditch B-8 Excavation Areas and DRO Results) presents sample results and areas that were excavated, but it does not appear that confirmation samples were collected at the bottom of the excavation. The excavation bottom samples were required by NMED's March 14, 2009 letter *Approval with Direction* which stated "[i]f the excavation does not exceed three feet below ground surface (bgs), the Permittee may collect confirmation samples from the bottom of the excavations only. If the excavation exceeds three feet bgs, then confirmation samples must be collected from all sidewalls of the excavations in addition to from the base of the excavations." The Permittee did not follow this directive, for example, in Area 3, which was excavated to seven feet; confirmation samples were not collected from the base of this excavation.

Response to Comment 1 cont'd

Sample CS-14, located on the northwest corner of Area 3, was collected at 7 ft bgs from the edge of Areas 3 and 4. Thus, it can be considered a base confirmation sample for Area 3 and a sidewall confirmation sample for Area 4.

Sample CS-22 was collected approximately 2 feet north of Area 3. CS-22 was collected at 7 ft bgs to vertically delineate DRO contamination discovered in samples CS-19, CS-20, and CS-21 (3 ft bgs, 3.5 ft bgs, and 3.5 ft bgs, respectively). These samples, in part, necessitated extending the depth of the excavation in Area 3 (from 3 ft bgs to 7 ft bgs). Sample CS-22 was initially planned to be a base confirmation sample in Area 3; there are no DRO exceedances in the immediate vicinity of this sample location necessitating excavation deeper than 7 ft bgs. However, due to the nature of excavating with a backhoe (i.e. the precision and accuracy of the backhoe) and the fact that the areas were measured after the excavation had been completed, the portion of Area 3 including CS-22 was excavated to 13 ft bgs. Western believes that CS-22 may still be used to demonstrate vertical delineation (as a base sample) at Area 3 at a depth of 7 ft bgs even though it is technically located approximately 2 feet north of Area 3.

NMED Comment 1 cont'd

In Area 4, which was excavated to 13 feet, the Permittee collected six samples around the perimeter of the excavation at a depth of 13 feet and only three samples were collected from the base of the excavation.

Response to Comment 1 cont'd

Western is unclear as to NMED's comment that six samples were collected from around the perimeter of the excavation at a depth of 13 feet. As presented on Figure 5 and Table 1, three samples were collected from the base at perimeter of the 13 foot excavation (A-1, A-2, and A-3) and three internal base samples were collected from within the 13 foot excavation (CS-1, CS-16, and "B"). Thus, Western believes a total of six base confirmation samples were collected from Area 4. Further, four sidewall samples were collected from the 13-foot excavation. These sidewall samples include B-8 Center (5 feet), E (5 feet), K (5 feet), and M (5 feet).

To help clarify this issue, Western has created Figure 7 to illustrate base and sidewall confirmation samples for each area. The sidewall samples are shown as orange and base samples are shown as magenta. There are a few samples that can be considered both base and sidewall samples. For example, CS-14 is collected at 7 ft bgs on the corner of Area 3 and Area 4. In respect to Area 3, this is a base sample. In respect to Area 4, it is a sidewall sample. These "base/sidewall" samples are illustrated on Figure 7 in cyan. Figure 7 is included as an attachment to this correspondence and, pending NMED approval, will be included in a revised version of the Report.

NMED Comment 1 cont'd

At one point (A (B8-NEW-SE)) there is an increase in DRO concentration with depth and apparently no sample collected to demonstrate that the DRO-contaminated soil was removed.

Response to Comment 1 cont'd

At the time that additional delineation samples were being collected in the vicinity of A(B8-NEW-SE) (henceforth referred to as "A") to help determine the vertical extent of DRO contamination, a hollow stem auger drill rig was being used to collect soil samples. Due to the open excavation immediately adjacent to "A", deeper samples were not able to be safely collected at this exact location. Instead, deeper samples were collected at B(B8-NEW-SE-S1) (henceforth referred to as "B") which also showed DRO exceedances at depths as deep as 7 ft bgs. The "B" sample location is approximately 2 to 3 feet east of "A" and samples collected from 13 ft bgs, 18 ft bgs, and 23 ft bgs were each non-detect for DRO, thus verifying that the 13 ft bgs excavation was sufficient to remove DRO-contaminated soil

NMED Comment 1 cont'd

In order to determine whether or not the removal of all soils containing concentrations of DRO above 890 mg/kg from the fan-out area was completed, the Permittee needed to collect samples from the base and sidewalls of the excavation. Therefore, confirmation samples must be collected at the excavation bottom and from the sidewalls using a systematic sampling pattern and samples must also be collected from areas of visible staining, elevated moisture levels, and contaminated zones identified by field-screening and beneath areas with detected residual contamination.

Response to Comment 1 cont'd

In the March 14, 2009 letter *Approval with Direction*, NMED had originally requested that 13 confirmation samples be collected for the original excavation area. However, because CS-2, CS-4, and CS-8 exceeded the DRO cleanup level, the excavation was expanded and 33 confirmation samples were collected (26 base, 4 sidewall, 3 base/sidewall – see Figure 7).

Western collected confirmation samples in accordance with the locations that NMED approved in the “Approval With Direction, Railroad Rack Lagoon Fan-Out Area Excavation Work Plan, Western Refining Southwest, Inc., Gallup Refinery, EPA ID #: NMD000333211, HWB-GRCC-07-002.” When the size of the excavation was increased due to DRO exceedances, the same methodology was used to collect additional confirmation samples. An example of this methodology is shown using samples CS-19, CS-20, CS-21 and CS-22. Samples CS-19, CS-20, and CS-21 were above the DRO cleanup level at 3 or 3.5 ft bgs. Thus, the excavation was extended to 7 ft bgs in this area and CS-22 (horizontally located in the middle of CS-19, CS-20, and CS-21) was collected to vertically delineate DRO contamination.

As mentioned in section 4.3.3 of the Report, due to limited correlation shown between field screening data and confirmation sampling results, NMED permitted Western to proceed with the excavation utilizing visual observations and confirmation sampling results in lieu of field screening. When areas exhibiting visual contamination were identified, the size of the excavation was expanded and confirmation samples were collected. This was the case for CS-19 and CS-20. When the CS-19 and CS-20 samples were being collected, visible staining was observed. Thus, once the laboratory results were received, it was decided to excavate the area to 7 feet. This was the depth at which the staining was visibly removed.

NMED Comment 1 cont'd

Until the Permittee defines the extent of the contamination, NMED cannot determine if further remediation is necessary. The Permittee must conduct additional confirmation sampling and, if necessary, conduct additional excavation activities if the confirmation samples contain DRO concentrations greater than the acceptable cleanup level.

Response to Comment 1 cont'd

As mentioned in Section 7.0 of the Report, the B8 DRO exceedances discovered during the investigation/excavation are surrounded by a total of 67 soil samples showing DRO concentrations less than the cleanup standard. Western believes these 67 soil samples define the extent of the DRO contamination and no additional confirmation sampling is necessary. A total of 784 cubic yards of DRO-contaminated soil encompassed by these 67 samples has been excavated. Therefore, Western believes no further excavation activities are necessary.

NMED Comment 1 cont'd

In the revised Report, the Permittee must submit a figure depicting the locations of the final confirmation sample locations, depths the samples were taken, and the analytical results. The Permittee must submit proposed confirmation sample locations for NMED approval no less than 30 days before confirmation sampling activities begin.

Response to Comment 1 cont'd

Figure 5 of the Report shows all sample locations, depths, and analytical results. Figure 7 and Table 2 (provided as attachments to this correspondence) have been created to show only the final confirmation sample locations. The revised Report will be updated to include Figure 7 and Table 2.

Note that Figure 7 and Table 2 only show confirmation sample results of those samples that were collected from the base or sidewall of the final excavation. Numerous other samples (for example, CS-24 and CS-18) were also necessary for delineating the DRO contaminated area. However, since these samples were not collected from the base or sidewall of the final excavation, they are not included on Figure 7 or Table 2. Figure 7 and Table 2 will be incorporated into the revised Report.

NMED Comment 2

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states "[c]onfirmation sample locations were strategically located to supplement the existing DRO data." The Permittee must include more detail regarding the confirmation sampling (i.e., provide the rationale for the "strategic" location of the confirmation samples). The Permittee must revise

the Report to include specific details regarding the confirmation sampling locations and the logic behind the selection of the sampling locations.

Response to Comment 2

Thirteen original confirmation sample locations and depths were approved by NMED in the "Approval With Direction, Railroad Rack Lagoon Fan-Out Area Excavation Work Plan, Western Refining Southwest, Inc., Gallup Refinery, EPA ID #: NMD000333211, HWB-GRCC-07-002." These locations were selected because limited DRO data existed in these areas. These confirmation samples are identified as CS-1 through CS-13. If a confirmation sample showed a DRO exceedance, the excavation was expanded. As the excavation was expanded, additional confirmation samples were collected to verify that the soil remaining in place was below the DRO cleanup standard. An example of this logic is provided in the response to Comment 1 (CS-19, CS-20, CS-21, and CS-22).

NMED Comment 3

In Section 3.2 (Excavation Activities), page 3-2, paragraph 3, the Permittee states "[d]ue to confirmation sample DRO exceedances, the size of the excavation; as proposed in the 2008 Excavation Work Plan, was increased ... Excavation activities continued through October 2009 due to additional confirmation sample exceedances and visually impacted soil." The Permittee must revise the Report to include additional detail regarding the excavation. For example, the Permittee must state, or include a figure with, the locations where the exceedances were found (e.g., sample location, depth, cardinal direction), discuss the amount of soil removed during each of the excavations, and describe confirmation sampling.

Response to Comment 3

Per the 2008 Excavation Work Plan, confirmation samples CS-1 through CS-13 were collected from the original excavation. The results of these samples, as well as the results of all samples associated with the excavation, are shown on Table 1 and Figure 5 of the Report. Of the original 13 confirmation samples, CS-2, CS-4, and CS-8 exceeded the DRO cleanup standard. Figure 4 shows the proposed excavation area versus the actual excavation area. As shown on Figure 4, the original confirmation sample exceedances prompted the excavation to be expanded generally to the west and southwest. However, each exceedance identified during delineation and excavation activities prompted additional investigation/excavation. As shown on Table 1, 28 exceedances were identified in the B-8 Excavation. Western deemed it more appropriate to illustrate these exceedances on a figure (Figure 5) rather than attempt to describe each of them in the text of the report.

NMED also requested that Western provide the amount of soil removed during each of the excavations. Western considers this to be a single excavation that was continuously expanded until the DRO contaminated soil was delineated and removed. Intermediate volumes were not required as part of the 2008 Excavation Work Plan, thus this information was not recorded or calculated. However, the final total volume is presented in Section 7.0 of the Report.

Confirmation soil sampling procedures are discussed in Section 4.3.2.2 and 4.3.1.2 of the Report.

NMED Comment 4

In Section 3.2 (Excavation Activities), page 3-2 and 3-3, the Permittee states "Test Pit B-8 confirmation sample locations and results are illustrated in Figure 5. Area 1 was excavated to depth of 3 feet below ground surface (ft bgs), and excavation activities in this area were overseen by Trihydro. Area 2 was excavated to a depth of 5 ft bgs by Gallup personnel. Area 3 and 4 excavations were overseen by a combination of Trihydro and Gallup personnel and extended to 7 and 13 ft bgs." The Permittee must revise the Report to discuss the basis for excavation to the various depths (e.g., the confirmation sample detections that indicated the need for additional soil removal). The Permittee must revise Figure 5 or provide an additional figure to show the final confirmation sample locations, see Comment 1.

Response to Comment 4

As presented in the Report, each area was excavated until the outermost samples (both horizontal and vertical) were below the DRO cleanup standard of 890 mg/kg. For example, an exceedance of DRO was discovered at 9 ft bgs at sample location "A." Therefore, this area was excavated to 13 ft bgs which was shown to be below the cleanup standard at sample location "B." The final confirmation samples prompting cessation of the excavation are illustrated on Figure 7 and Table 2. This Figure and Table are provided as attachments to this document and, pending NMED approval, will be provided in the revised Report.

NMED Comment 5

In Section 4.3.1.1 (Delineation Sample Locations), page 4-2, paragraph 2, the Permittee states "[t]he sampling locations in these three delineation sampling events (May, August, and December 2007) were determined based on exceedances identified during the preceding sampling events. These locations are illustrated on Figures 5 and 6." The Permittee must list these sampling locations by name in the text, so that the locations can be identified in the figures. Additionally, Figure 5 appears to illustrate the locations of multiple sampling events beyond the

three delineation events mentioned above. The Permittee must revise the Report to refer to specific sampling locations, instead of referring to the locations generally.

Response to Comment 5

A total of 101 samples were collected throughout the investigation/excavation. Western believes that attempting to discuss each individual sample result, whether or not the result prompted additional excavation, and what direction the excavation was expanded due to the result of the sample would cause more confusion than clarification. Instead, Western provided this information on Figure 5 where the information can be visualized. Each exceedance identified during delineation and excavation activities prompted additional investigation/excavation. The excavation was expanded until data showed that the remaining outermost samples (both horizontally and vertically) were below the cleanup standard.

As mentioned in NMED's comment, the text of the Report refers to three delineation events (May, August, and November 2007). These delineation events were used to determine the initially proposed excavation area presented in the 2008 Excavation Work Plan, dated September 17, 2008. Western considers subsequent field activities (excavation and confirmation sampling) as one, continuous field event, which is why multiple excavation "events" are not discussed in the text. The data collected from excavation and confirmation sampling is presented on Table 1 and Figure 5 in addition to the data collected from the three delineation events, for completeness. Sample IDs, the date which the sample was collected, the depth at which the sample was collected, and whether or not the sample exceeded the DRO cleanup standards are shown on Table 1. Sample locations, depths, and results are shown Figures 5 and 6. The sample dates shown on Table 1 may be used to determine with which event each sample is associated.

NMED Comment 6

In Section 4.3.2.1 (Confirmation Sample Locations), page 4-4, paragraph 1, the Permittee states "[a] total of ten sidewall and base confirmation sample locations were proposed in the 2008 Excavation Work Plan. Three additional locations were added at the suggestion of NMED in the December 11, 2008 Approval with Direction letter provided as Appendix F. These 13 locations were strategically located in areas where DRO delineation data was limited in an attempt to fill potential data gaps. Of the 13 approved confirmation sampling locations, 3 exceeded the DRO cleanup standard prompting expansion of the excavation." The Permittee must revise the Report to be specific regarding the sample location names (e.g., instead of stating, "of the 13 approved sampling locations, 3 exceeded," list the specific location designations).

Response to Comment 6

As shown in Table 1 of the 2008 Excavation Work Plan, the original proposed confirmation sampling locations are designated CS-1 through CS-10. Per NMED's conditional approval, CS-11 through CS-13 were added. As shown in Table 1 and Figure 5 of the Report, CS-2, CS-4, and CS-8 exceeded the DRO cleanup standard. The revised Report will specify CS-2, CS-4, and CS-8 as the three original confirmation sample locations that exceeded the cleanup level.

NMED Comment 7

In Section 4.4 (Investigation Derived Waste), page 4-5, the Permittee states "[e]xcavated soils and soil cuttings produced during the sampling events have been transported to Gallup's Land Farm as permitted by OCD." The Permittee must revise the Report to describe the estimated volume of soil cuttings and excavated soil that were disposed of at the Land Farm.

Response to Comment 7

As stated in Section 7.0 of the Report, approximately 784 cubic yards of soil were excavated from B-8. Dimensions for the B-9 excavation were also included in the Report, however the volume of soil was not. Approximately 3 cubic yards of soil were excavated from B-9. The revised Report will include the total cubic yards of soil excavated from B-9.

NMED Comment 8

In Section 6.1 (Test Pit B-9), the Permittee states "samples collected from each corner of the excavation at depths of 3 ft bgs and the center of the excavation at a depth of 5 ft bgs showed DRO concentrations below the clean up standard." The sample points are illustrated in Figure 6 (Railroad Rack Lagoon Overflow Ditch B-9 Final Excavation Area and Sample Results); the Permittee excavated the ditch to 5 feet, but in the figure it is not apparent that the 3 ft samples are sidewall samples. The Permittee must revise the Report and Figures to differentiate between sidewall and bottom confirmation samples (e.g., use different symbols or colors on the figures, provide additional figures or in a table cross-referenced in the figure key).

Response to Comment 8

If a sample is collected at the boundary of an area at a depth less than the total depth of the area, it is considered a sidewall sample. If a sample is collected at a depth equal to the total depth of a specific area, it is considered a base sample.

The revised Report will be updated to show base and sidewall samples as magenta and orange, respectively. For the B-9 Excavation, Figure 6 will be updated according to this color scheme.

Due to the complexity of Figure 5, Figure 7 has been created for the B-8 Excavation to show only the final confirmation samples. The above mentioned orange and magenta color scheme is used to differentiate between base and sidewall samples. There are a few samples that can be considered both base and sidewall samples. For example, CS-14 is collected at 7 ft bgs on the corner of Area 3 and Area 4. In respect to Area 3, this is a base sample. In respect to Area 4, it is a sidewall sample. These "base/sidewall" samples are illustrated on Figure 7 in cyan.

NMED Comment 9

In Section 6.2 (Test Pit B-8), the Permittee states "As illustrated on Figure 5, between delineation and confirmation sampling activities, a total of 67 soil samples showing DRO concentrations below the cleanup standard have been excavated from the vicinity of Test Pit B-8. A summary of the analytical data is provided as Table 1." Figure 5 and Table 1 appear to show either residual contamination, or that the Permittee did not collect confirmation samples from the base of the excavation. See Comment 1 regarding Figure 5, Table 1 and additional confirmation sampling requirements.

Response to Comment 9

Figure 5 and Table 1 show all delineation and confirmation sampling data, regardless of whether the data exceeds the DRO cleanup standard or not. The outermost (horizontally and vertically) data do not exceed the cleanup standard. Western deemed it appropriate to include the exceedances so that NMED could see that the DRO contamination has been delineated. Figure 7 and Table 2 have been created to show that confirmation samples below the cleanup standard surround the sidewalls and base of the excavation.

NMED FINAL COMMENT

The Permittee must address all comments contained in this NOD and submit a revised Work Plan to NMED and OCD on or before July 20, 2010. The revised Report must be accompanied by a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. In addition, the Permittees must submit a redline-strikeout version that includes all changes and edits to the Report (electronic copy) with the response to this NOD.

Final Comment Response

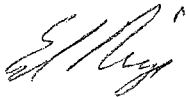

Western believes that the additional explanation provided in this response, along with Figure 7 and Table 2, show that the Fan-out Area DRO contamination has been delineated and excavated. Thus, Western hopes that a revised Work Plan will not be necessary. Upon NMED's approval of these responses, Western will provide a letter detailing the revisions to the Report and cross-referencing NMED's numbered comments.

Mr. James Bearzi
June 22, 2010
Page 11

Western will also provide an electronic redline-strikeout version that includes all changes and edits to the Report.

Western believes that, upon NMED receipt of these responses, a meeting between NMED and Western may be mutually beneficial to help clarify the topics presented in this correspondence. If you have any questions, or if we can be of further service to you, please do not hesitate to call me at (307) 745-7474.

Sincerely,

Ed Riege
Environmental Manager

New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, NM 87505-6303

RE: NMED's "NOTICE OF DISAPPROVAL
RAILROAD RACK LAGOON OVERFLOW DITCH AND FAN-OUT AREA,
SWMU No. 8 SUBSURFACE INVESTIGATION FINAL REPORT
WESTERN REFINING COMPANY SOUTHWEST, INC., GALLUP REFINERY EPA
ID # NMD000333211
HWB-WRG-10-002"

Dear Mr. Bearzi:

The purpose of this letter is to request an extension for a revised report as requested in the New Mexico Environment Department's (NMED) comments to the *Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8, Subsurface Investigation Final Report* (Report), dated January 6, 2010, submitted on behalf of Western Refining Company Southwest Inc., Gallup Refinery (Western). NMED issued comments to the Report in a *Notice of Disapproval* (NOD), dated May 12, 2010.

The final comment in the May 12 NOD requested that Western address all comments contained in the NOD and, "submit a revised Work Plan to NMED and OCD on or before July 20, 2010. The revised Report must be accompanied by a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. In addition, the Permittees must submit a redline-strikeout version that includes all changes and edits to the Report (electronic copy) with the response to this NOD."

During a phone call between Western and NMED on July 19, 2010, NMED clarified that a revised Report, not Work Plan, will be required. Western responded to NMED's NOD in a letter dated June 22, 2010. In this correspondence, Western proposed methods to revise the Report based on the comments that NMED issued in the NOD. NMED has not yet responded to the June 22 correspondence. Western is hesitant to update the Report until NMED replies to the June 22 correspondence due to the fact that the several revisions will be dependent on NMED's response. Therefore, Western is requesting an extension of the July 20, 2010 due date. Assuming NMED replies to the June 22 correspondence by July 30, 2010, and that NMED generally agrees that the revisions proposed in the June 22 correspondence will address NMED's comments, Western requests that the due date for the revised Report be extended to August 31, 2010. If you have any questions, or if we can be of further service to you, please do not hesitate to call me at (505) 722-0217.

Mr. James P. Bearzi

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

July 28, 2010

Mr. Ed Riege
Environmental Manager
Western Refining, Southwest Inc., Gallup Refinery
Route 3, Box 7
Gallup, New Mexico 87301

**RE: DIRECTION FOR ADDITIONAL
SOIL CONFIRMATION SAMPLE COLLECTION AND
APPROVAL OF EXTENSION REQUEST
RAILROAD RACK LAGOON OVERFLOW DITCH AND FAN-OUT AREA,
SWMU No. 8 SUBSURFACE INVESTIGATION FINAL REPORT
WESTERN REFINING COMPANY SOUTHWEST, INC., GALLUP REFINERY
EPA ID # NMD000333211
HWB-WRG-10-002**

Dear Mr. Riege:

The New Mexico Environment Department (NMED) received Western Refining Company Southwest Inc., Gallup Refinery's (Permittee) letter entitled *NMED's "Notice of Disapproval Railroad Rack Lagoon Overflow Ditch and Fan-out Area, SWMU No. 8 Subsurface Investigation Final Report"* (Response Letter) dated June 23, 2010. NMED still requires that the Permittee collect additional confirmation samples within the excavation.

NMED's December 11, 2009 *Approval with Modifications* required the Permittee to define the vertical and horizontal extent of contamination at the overflow and fan-out area. The *Railroad Rack Lagoon Overflow Ditch and Fan-out Area, SWMU No. 8 Subsurface Investigation Final Report* (Report), dated January 2010, does not document that the extent has, in fact, been defined. In the Response Letter, the Permittee provided a new figure (Figure 7) and table (Table 2) that focuses on the confirmation samples collected; these should be included in the revised

Ed Riege
Gallup Refinery
July 28, 2010
Page 2

Report. However, the confirmation samples clearly do not cover the entire excavation. The Permittee's explanation regarding confirmation sample collection in the Response Letter does not address NMED's concerns regarding the spacing of confirmation samples. As a result there is insufficient information for NMED to determine that the site has been cleaned up to the 890 mg/kg diesel range organics (DRO) soil screening level listed in NMED's Total Petroleum Hydrocarbon (TPH) Screening Guidelines. In order to determine whether or not the removal of all soils containing concentrations of DRO above 890 mg/kg from the fan-out area was completed, the Permittee must collect samples from the base and sidewalls of the entire excavation. The Permittee must conduct additional confirmation sampling and, if necessary, conduct additional soil removal activities if the confirmation samples contain DRO concentrations greater than the acceptable cleanup level.

NMED has amended Figure 7 to illustrate confirmation sample locations where the Permittee must collect confirmation samples. The Permittee must collect soil samples at the locations shown on Figure 7 as well as at any locations where field screening (visual, olfactory) indicates evidence of contamination. The additional confirmation sampling is limited in scope and only covers areas where confirmation samples have not been collected. The samples must be submitted to a laboratory for DRO analysis by EPA method 8015.

NMED received the Permittee's July 19, 2010 letter entitled *NMED's Notice of Disapproval Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report* (Extension Request) by email. The letter requests an extension for the submittal of the Report. NMED approves the extension request with the following modifications. The Permittee must collect the additional confirmation samples and address all comments contained in NMED's May 12, 2010 *Notice of Disapproval* and submit a revised Report to NMED on or before September 30, 2010.

The revised Report must be accompanied by a response letter that details where all revisions have been made, cross-referencing NMED's numbered comments. In addition, the Permittees must submit a redline-strikeout version that includes all changes and edits to the Report (electronic copy) with the response to this NOD.

RE: NMED's "Direction for Additional Soil Confirmation Sample Collection and Approval of Extension Request, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area SWMU No. 8 Subsurface Investigation Final Report Western Refining Company Southwest, Inc., Gallup Refinery EPA Id # NMD000333211 HWB-WRG-10-002"

Dear Ms. Van Horn:

The purpose of this letter is to respond to the New Mexico Environment Department's (NMED) *Direction for Additional Soil Confirmation Sample Collection and Approval of Extension Request, Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8 Subsurface Investigation Final Report, Western Refining Company Southwest, Inc., Gallup Refinery EPA ID # NMD000333211 HWB-WRG-10-002* (Direction for Additional Sampling), dated July 28, 2010. The Railroad Rack Lagoon Overflow Ditch and Fan-Out Area, SWMU No. 8, Subsurface Investigation Final Report (Report) was submitted on behalf of Western Refining Company Southwest Inc., Gallup Refinery (Western) on January 6, 2010. NMED issued comments to the Report in a Notice of Disapproval (NOD), dated May 12, 2010. Western responded to NMED's NOD comments in a correspondence dated June 22, 2010. NMED's July 28 Direction for Additional Sampling was issued in response to Western's June 22 correspondence.

In the Direction for Additional Sampling, NMED requested that Western collect 11 additional confirmation samples to confirm that soil exceeding NMED's Diesel Range Organic (DRO) clean up standard of 890 mg/kg has been removed from the Fan-Out Area. Western agrees to collect the additional confirmation samples at the NMED-proposed locations. Western assumes that NMED's other NOD comments have been adequately addressed in Western's June 22 correspondence. Previously approved sample collection techniques (i.e. collecting samples using a hand auger, spade, or back hoe bucket) will be utilized.

NMED requested that additional sampling be conducted and the revised Report be submitted on or before September 30, 2010. If the results of the additional confirmation sampling are below the clean up standard, Western should be able to meet this deadline. However, if confirmation sampling suggests that additional excavation is required, an additional extension may be needed. Should this situation arise,

Mr. James P. Bearzi
August 5, 2010
Page 2

Western will contact NMED to discuss the volume of soil requiring excavation and the time needed to perform this work.

Western has begun making preparations for the additional confirmation sampling. The Report will be revised to include the results of the additional confirmation sampling. Other Report revisions described in Western's June 22 correspondence will also be made. The revised Report will be accompanied by a response letter detailing where revisions have been made, cross-referencing NMED's numbered comments. A redline-strikeout version that includes changes and edits to the report (electronic copy) will also be submitted.

If you have any questions, or if we can be of further service to you, please do not hesitate to call me at (505) 722-0217.

Sincerely,
Western Refining Company

Ed Riege
Environmental Superintendent

APPENDIX M

NMED CLEANUP STANDARDS

Trihydro

A TPH screening guideline was calculated for each of the types of petroleum product based on the assumed composition from Table 1 for petroleum products and the direct soil standards incorporating ceiling concentrations given in the MADEP VPH/EPH Excel spreadsheet for each of the carbon fractions. Groundwater concentrations are based on the weighted sum of the noncarcinogenic toxicity of the petroleum fractions.

Method 1 from the MADEP VPH/EPH document was applied, which represents generic cleanup standards for soil and groundwater. Method 1 applies if contamination exists in only soil and groundwater. The MADEP VPH/EPH further divides groundwater into standards. Standard GW-1 applies when groundwater may be used for drinking water purposes. GW-1 standards are based upon ingestion and use of groundwater as a potable water supply. The TPH screening guidelines for sites with potable groundwater are presented in Table 2a.

Table 2a. TPH Screening Guidelines for Potable Groundwater (GW-1)

Petroleum Product	TPH		Concentration in Groundwater (mg/L)
	Residential Direct Exposure (mg/kg)	Industrial Direct Exposure (mg/kg)	
Diesel #2/crankcase oil	520	1120	1.72
#3 and #6 Fuel Oil	440	890	1.34
Kerosene and jet fuel	760	1810	2.86
Mineral oil dielectric fluid	1440	3040	3.64
Unknown oil ^a	200	200	0.2
Waste Oil ^b	2500	5000	Petroleum-Related Contaminants
Gasoline	Not applicable	Not applicable	Petroleum-Related Contaminants
^a Sites with oil from unknown sources must be tested for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs) to determine if other potentially toxic constituents are present. The TPH guidelines in Table 2 are not designed to be protective of exposure to these constituents therefore they must be tested for, and compared to, their individual NMED soil screening guidelines. ^b Compositional assumption for waste oil developed by NMED is based on review of chromatographs of several types of waste oil. Sites with waste oil must be tested for VOCs, SVOCs, metals, and PCBs to determine if other potentially toxic constituents are present. The TPH guidelines in Table 2 are not designed to be protective of exposure to these constituents therefore they must be tested for, and compared to, their individual NMED soil screening guidelines.			

The second standard is GW-2, which is applicable for sites where the depth to groundwater is less than 15 feet from the ground surface and within 30 feet of an occupied structure. The structure may be either residential or industrial. GW-2 standards are based upon "inhalation exposures that could occur to occupants of the building impacted by volatile compounds, which partition from the groundwater" (MADEP 2001). The GW-2 screening guidelines ONLY apply for the evaluation of inhalation exposures. If potential ingestion or contact with contaminated soil and/or
