Isaac,

Your request for no further action at this release site is denied at this time. It is unclear at what depth any of the samples were taken. OCD will require the chloride contamination to be delineated to 250 mg/kg or, natural background for the area, whichever is greater (or to the maximum extent as is practicable). It was stated on the C-141 and in the workplan submittal, that a water sample was taken, with the analysis showing 1420 ppm. I have not seen any of the lab data on any of the samples, but typically a water sample analysis (for our purposes) is reported in mg/L.

In the email submittal of the workplan proposal, there are pages for Analytical Results (Appendix A), Site Photographs (Appendix B), and C-141 (Appendix C). Please note that none of these documents were included with this submittal. I do appreciate you not trying to send this much information in an email format, but would request the lab analytical data be made available in hard copy.

Please make arrangements to supply this information and to perform a more complete delineation of the site.

If you have any questions or concerns, contact me.

MIKE BRATCHER
