EXAMINER HEARING DECEMBER 12, 2019**

CASE No. 20933

MALAGA SWD No. 4 WELL

EDDY COUNTY, NEW MEXICO

**BLACK RIVER WATER
MANAGEMENT COMPANY, LLC**

**STATE OF NEW MEXICO
DEPARTMENT OF ENERGY, MINERALS AND NATURAL RESOURCES
OIL CONSERVATION DIVISION**

**APPLICATION OF BLACK RIVER WATER
MANAGEMENT COMPANY, LLC TO
AMEND ADMINISTRATIVE ORDER SWD-
1738 FOR MALAGA SWD NO. 4 WELL,
EDDY COUNTY, NEW MEXICO.**

CASE NO. 20933

AFFIDAVIT OF MARSHALL BROOKS VERSCHOYLE

I, Marshall Brooks Verschoyle, of lawful age and being first duly sworn, declares as follows:

1. My name is Marshall Brooks Verschoyle. I work for MRC Energy Company, an affiliate of Matador Production Company ("Matador"), as the surface land manager for MRC Energy. Black River Water Management Company, LLC ("Black River Water Management") is the applicant in this case and is an affiliated company.

2. I have previously testified before the New Mexico Oil Conservation Division as an expert witness in petroleum land matters. My credentials as an expert in petroleum land matters have been accepted by the Division and made a matter of record.

3. I am familiar with the application filed by Black River Water Management in this case, and I am familiar with the status of the lands in the subject area.

4. No other parties have filed an entry of appearance and no party has expressed an objection to the application. Therefore, I do not expect any opposition at hearing.

5. Exhibit A-1, attached hereto, is a copy of Administrative Order SWD-1738 issued by the Division on June 13, 2018, approving injection through its Malaga SWD No. 4 (API 30-015-44514), with a location 1,489 feet from the north line and 490 feet from the west

line (Unit E) of Section 11, Range 24 South, Range 28 East, NMPM, Eddy County, New Mexico.

6. Order SWD-1738 authorizes disposal of oil field produced water through an open-hole completion into an interval consisting of the Devonian formation from approximately 14,228 feet to approximately 15,103 feet. *See* Exhibit A-1. The order further provides that injection is authorized through an internally coated 4.5-inch or smaller tubing within 7-5/8th inch casing. *See id.*

7. The Malaga SWD No. 4 well has been drilled and has been continuously injecting since September 4, 2018. The well is equipped with surface casing, two stages of intermediate casing, and 7-5/8th-inch production casing. All casing is cemented to the surface.

8. Black River seeks an amendment to Administrative Order SWD-1738 permitting it to use 5.5-inch injection tubing. The tubing will be placed inside the production casing.

9. All other approved well designs and permit conditions under Administrative Order SWD-1738 will remain unchanged.

10. Notice of this application was provided to the surface owner and oil and gas lessees and operators of record within a one-mile area of review that are entitled to receive notice. Parties entitled to notice were identified based on a determination of the title of lands and interests as recorded in the records of Lea County and from a review of New Mexico Oil Conservation Division and BLM operator records as of the time the application was filed.

11. It is my opinion that Black River Water Management undertook a good faith effort to locate and identify the correct parties and valid addresses required for notice within the one-mile area of review. To the best of my knowledge the addresses used for notice purposes are valid and correct.

12. I provided the law firm of Holland & Hart LLP a list of names and addresses for the parties entitled to notice within the one-mile area of review.

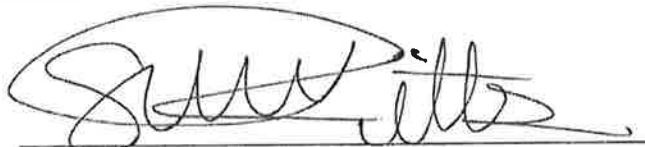

13. Exhibit A-2 is a copy of an attorney affidavit prepared by Holland & Hart LLP reflecting that notice of this hearing was sent to the parties entitled to notice that I identified. Also included within that exhibit is an affidavit of publication, reflecting that constructive notice of the application and the hearing was provided to all parties entitled to notice, identifying all parties by name, in a newspaper of general circulation in Eddy County, New Mexico.

14. **Exhibits A-1 through A-2** were either prepared by me or compiled under my direction and supervision or constitute administrative records of the Oil Conservation Division.
FURTHER AFFIANT SAYETH NOT.

Heather Riley, Division Director
Oil Conservation Division

Administrative Order SWD-1738
June 13, 2018

**ADMINISTRATIVE ORDER
OF THE OIL CONSERVATION DIVISION**

Pursuant to the provisions of Division Rule 19.15.26.8(B) NMAC, Black River Management Company, LLC (the "operator") seeks an administrative order for its Malaga SWD Well No. 4 (the "proposed well") with a location of 1489 feet from the North line and 490 feet from the West line, Unit letter E of Section 11, Township 24 South, Range 28 East, NMPM, Eddy County, New Mexico, for the purpose of commercial disposal of produced water.

THE DIVISION DIRECTOR FINDS THAT:

The application has been duly filed under the provisions of Division Rule 19.15.26.8(B) NMAC and satisfactory information has been provided that affected parties have been notified. Three objections were received within the prescribed waiting period for the expanded notice with two withdrawn following negotiated resolutions. The third objection was addressed by Division Case No. 16130 and the resulting Order No. R-14715 which remanded the application to the administrative review process. The applicant has presented satisfactory evidence that all requirements prescribed in Division Rule 19.15.26.8 NMAC have been met and the operator is in compliance with Division Rule 19.15.5.9 NMAC.

Application for Disposal in Devonian and Silurian Formations: Due to the potential for the projected injection volume of the proposed well to impact an area greater than the one-half mile radius applied in Division Form C-108 and Division rule, the applicant has provided the following supplementary information:

1. Notification following Division Rule 19.15.26.8(B) NMAC for a radius of one mile from the surface location of the proposed well;
2. An expanded Area of Review for wells penetrating the disposal interval for a radius of one mile from the surface location of the proposed well; and
3. A statement by a qualified person assessing the potential of induced-seismic events associated with the disposal activities for the predicted service life of the proposed well.

EXHIBIT A

BEFORE THE OIL CONSERVATION DIVISION
Santa Fe, New Mexico
Exhibit No. A1
Submitted by: **Black River WMC**
Hearing Date: December 12, 2019
Case No. 20933

IT IS THEREFORE ORDERED THAT:

The applicant, Black River Water Management Company, LLC (OGRID 371287), is hereby authorized to utilize its Malaga SWD Well No. 4 (API 30-015-44514) with a location of 1489 feet from the North line and 490 feet from the West line, Unit letter E of Section 11, Range 24 South, Range 28 East, NMPM, Eddy County, for disposal of oil field produced water (UIC Class II only) through open-hole completion into an interval consisting of the Devonian formation from approximately 14228 feet to approximately 15103 feet. Injection will occur through a tubing system with internally-coated, 4.5-inch or smaller tubing within the 7 $\frac{1}{2}$ -inch casing and a packer set within 100 feet of the top of the disposal interval.

This permit does not allow disposal into formations below the Silurian formations including the Montoya formation and the Ellenburger formation (lower Ordovician) or lost circulation intervals directly on top and obviously connected to these formations.

Prior to commencing disposal, the operator shall submit mudlog and geophysical logs information, to the Division's District geologist and Santa Fe Bureau Engineering office, showing evidence agreeable that only the permitted formation is open for disposal including a summary of depths (picks) for contacts of the formations which the Division shall use to amend this order for a final description of the depth for the injection interval. If significant hydrocarbon shows occur while drilling, the operator shall notify the Division's District II and the operator shall be required to receive written permission prior to commencing disposal.

If cement does not circulate on any casing string excluding the 7 $\frac{1}{2}$ -inch casing, the operator shall run a cement bond log (CBL) or other log to determine top of cement and shall notify the Artesia District with the top of cement on the emergency phone number prior to continuing with any further cement activity with the proposed well. If cement did not tie back in to next higher casing shoe, the operator shall perform remedial cement job to bring cement, at a minimum, 200 feet above the next higher casing shoe.

The operator shall run a CBL (or equivalent) for the 7 $\frac{1}{2}$ -inch production casing and demonstrate (for the cement tie back with the 10 $\frac{1}{4}$ -inch intermediate casing) a top-of-cement depth no deeper than 8000 feet below ground level. The operator shall provide a copy of the CBL to the Division's District II prior to commencing disposal.

IT IS FURTHER ORDERED THAT:

The operator shall take all steps necessary to ensure that the disposed water enters only the approved disposal interval and is not permitted to escape to other formations or onto the surface. This includes the completion and construction of the well as described in the application and, if necessary, as modified by the District Supervisor.

After installing tubing, the casing-tubing annulus shall be loaded with an inert fluid and equipped with a pressure gauge or an approved leak detection device in order to determine leakage in the casing, tubing, or packer. The casing shall be pressure tested from the surface to the packer setting depth to assure casing integrity.

The well shall pass an initial mechanical integrity test ("MIT") prior to initially commencing disposal and prior to resuming disposal each time the disposal packer is unseated. All MIT procedures and schedules shall follow the requirements in Division Rule 19.15.26.11(A) NMAC. The Division Director retains the right to require at any time wireline verification of completion and packer setting depths in this well.

The wellhead injection pressure on the well shall be limited to **no more than 2846 psi**. In addition, the disposal well or system shall be equipped with a pressure limiting device in workable condition which shall, at all times, limit surface tubing pressure to the maximum allowable pressure for this well.

The Director of the Division may authorize an increase in tubing pressure upon a proper showing by the operator of said well that such higher pressure will not result in migration of the disposed fluid from the target formations. Such proper showing shall be demonstrated by sufficient evidence including but not limited to an acceptable step-rate test.

The operator shall notify the supervisor of the Division's District II office of the date and time of the installation of disposal equipment and of any MIT so that the same may be inspected and witnessed. The operator shall provide written notice of the date of commencement of disposal to the Division's District II office. The operator shall submit monthly reports of the disposal operations that includes number of days of operation, injection volume, and injection pressure on Division Form C-115, in accordance with Division Rules 19.15.26.13 and 19.15.7.24 NMAC.

The injection authority granted under this order is not transferable except upon Division approval. The Division may require the operator to demonstrate mechanical integrity of any injection well that will be transferred prior to approving transfer of authority to inject.

The Division may revoke this injection order after notice and hearing if the operator is in violation of Rule 19.15.5.9 NMAC.

The disposal authority granted herein shall terminate one (1) year after the effective date of this Order if the operator has not commenced injection operations into the subject well. One year after the last date of reported disposal into this well, the Division shall consider the well abandoned, and the authority to dispose will terminate *ipso facto*. The Division, upon written request mailed by the operator prior to the termination date, may grant an extension thereof for good cause.

Compliance with this Order does not relieve the operator of the obligation to comply with other applicable federal, state or local laws or rules, or to exercise due care for the protection of fresh water, public health and safety and the environment.

Jurisdiction is retained by the Division for the entry of such further orders as may be necessary for the prevention of waste and/or protection of correlative rights or upon failure of the operator to conduct operations (1) to protect fresh or protectable waters or (2) consistent with the requirements in this order, whereupon the Division may, after notice and hearing, terminate the

DEPARTMENT
OIL CONSERVATION DIVISION
SANTA FE, NEW MEXICO

The State of New Mexico through its Oil Conservation Division hereby gives notice pursuant to law and the Rules and Regulations of the Division of the following public hearing to be held at 8:15 A.M. on December 12, 2019, in Porter Hall, the Oil Conservation Division Hearing Room, 1st Floor, Wendell Chino Building, 1220 South St. Francis, Santa Fe, New Mexico, before an examiner duly appointed for the hearing. If you are an individual with a disability who is in need of a reader, amplifier, qualified sign language interpreter, or any other form of auxiliary aid or service to attend or participate in the hearing, please contact: Florene Davidson at 505-476-3458 or through the New Mexico Relay Network, 1-800-659-1779 by December 2, 2019. Public documents, including the agenda and minutes, can be provided in various accessible formats. Members of the public may obtain copies of the docket by contacting Ms. Davidson at the phone number indicated above. Also, the docket will be posted on the Oil Conservation Division website at www.emnrd.state.nm.us/OCD/. Please contact Ms. Davidson if a summary or other type of accessible form is needed.

STATE OF NEW MEXICO TO:

All named parties and persons having any right, title, interest or claim in the following case and notice to the public.

(NOTE: All land descriptions herein refer to the New Mexico Principal Meridian whether or not so stated.)

Case No. 20933: Application of Black River Water Management Company, LLC to Amend Administrative Order SWD-1738 for Malaga SWD No. 4 Well, Eddy County, New Mexico. Applicant in the above-styled cause seeks an order amending Administrative Order SWD-1738 to permit increase the diameter of the injection tubing in its Malaga SWD No. 4 Well (API No. 30-015-44514) from 4.5 inches to 5.5 inches. Administrative Order SWD-1738 currently allows injection tubing that is 4.5 inches or smaller. The subject well is located 1,489 feet from the north line and 490 feet from the west line (Unit E) of Section 11, Township 24 South, Range 28 East, NMPM, Eddy County, New Mexico. All other approved well designs and permit conditions under Administrative Order SWD-1738 are proposed to remain unchanged. The Malaga SWD No. 4 Well is located approximately 1 mile southeast of Malaga, N.M.

**APPLICATION OF BLACK RIVER WATER
MANAGEMENT COMPANY, LLC TO
AMEND ADMINISTRATIVE ORDER SWD-
1738 FOR MALAGA SWD NO. 4 WELL,
EDDY COUNTY, NEW MEXICO.**

CASE NO. 20933

AFFIDAVIT OF DR. EDMUND LOCKE FROST III

I, Dr. Edmund Locke Frost III, of lawful age and being first duly sworn, declares as follows:

1. My name is Dr. Edmund Locke Frost III. I work for MRC Energy Company, an affiliate of Matador Production Company (“Matador”), as the senior vice president of geoscience for MRC Energy and all of its affiliates. Black River Water Management Company, LLC (“Black River Water Management”) is the applicant in this case and is an affiliated company.

2. I have previously testified before the New Mexico Oil Conservation Division as an expert witness in petroleum geology. My credentials as an expert in petroleum geology have been accepted by the Division and made a matter of record.

3. I am familiar with the application filed by Black River Water Management in this case and have conducted a geologic study of the subject lands. My opinions and conclusions are based on my review of both publicly available data and information on the geology and injection interval in this area, as well as proprietary and confidential business records.

4. In my opinion, the Devonian formation in this area is suitable for injection and is capable of accepting injection volumes and rates proposed with an increase in tubing size from 4.5 inches to 5.5 inches. Injection at higher rates through 5.5-inch tubing will not impair

correlative rights and will not adversely affect the production of hydrocarbons, nor will it threaten drinking water sources or zones of freshwater in the area.

5. In support of its application to increase the injection tubing size in the Malaga SWD No. 4 well from 4.5 inches to 5.5 inches, I prepared a 20-well modeling study characterizing the fault-slip potential of known faults in the area resulting from increased injection in the proposed well at the proposed rates and volumes, taking into consideration all currently existing and proposed injection into the Devonian in the area. That study is attached as **Exhibit B-1**.

6. The results of the study indicate that the overall probability of a fault slip as a result of the proposed injection is less than 10 percent over a 25-year period, even with multiple high-volume injectors spaced roughly one mile apart. The geomechanical modeling shows that distance to failure for all faults in the study area is greater than 750 psi; meaning that aquifer pore pressure would need to increase by greater than 750 psi at a given fault plane for there to be a risk of failure. The model predicts a pressure increase of 362 psi by year 2045, assuming maximum injection rates for all wells in the study area, which is well below the potential threshold for fault failure. Therefore, I view this as a low-risk setting for fault-slip potential.

7. Caution still needs to be employed to avoid locating injection wells near potentially unstable geologic features. Accordingly, Black River Water Management screened the proposed location for this well, as it does for all its disposal wells, against its proprietary 3D seismic data to avoid injecting near faults. The location for the proposed well was chosen to avoid potential faults, which further reduces the risk.

8. In my opinion, granting this application will help conserve resources, avoid waste, and protect correlative rights.

FURTHER AFFIANT SAYETH NOT.

Fault-Slip Probability Assessment for the Malaga SWD #4 Tubing Upgrade, Eddy County New Mexico

Dr. Edmund L Frost III, Senior Vice President—Geoscience, Black River Water Management Company, LLC

In order to minimize the potential risk of induced seismicity associated with deep waste water disposal, Black River Water Management Company, LLC (“Black River”) has undertaken a study to characterize the fault-slip potential related to increasing the tubing size in the Malaga SWD #4 from 4.5 inches to 5.5 inches. This document presents the results of a 20 well model, which investigates the impact of increasing waste water injection rates in the Malaga SWD #4 from an average rate of roughly 30,000 bbl/day to 50,000 bbl/day until 2045 (Figure 1a, Table 1). This study utilizes a mix of public and proprietary data in conjunction with the Stanford Center for Induced and Triggered Seismicity’s (SCITS) Fault Slip Potential (FSP; Walsh et al., 2017) code (table 2).

Fault orientations (strike, dip) were obtained from 118 basement faults mapped in a proprietary 88 mi² prestack depth migrated (PSDM) 3D seismic volume. Fault orientations were calculated at multiple points along the trace of each fault in the injection interval from Black River’s structural framework model. The orientations of these faults were imported into FSP and assigned random locations in this model. Stress data was derived from borehole image log data in Black River’s Black River #1 SWD, where the maximum horizontal stress (SHmax) orientation was observed as N42°E. This orientation agrees with published regional stress orientations for Southern Eddy County of N35°E by Lund Snee and Zoback (2018). Horizontal stress magnitudes were not modeled explicitly by Black River, instead the published A_0 value of 0.52 (Lund Snee and Zoback 2018; Table 2) for southern Eddy County, New Mexico was used, which implies a pure normal faulting environment.

The impact of high-rate injection in the 20 well case can be seen as a modest regional increase in pore pressure with time (Figure 1b). At the Malaga SWD #4, the model predicts a reservoir pressure increase of 362psi by year 2045, At the modelled depth of 14,228 ft, this translates to a pore pressure gradient increase of 0.025 psi/ft. Results of the geomechanical modeling show that all faults have a “distance to failure” of greater than 750 psi; meaning that aquifer pore pressure would need to be increased by greater than 750 psi to potentially induce failure. The results of the model case presented here are well below this limit. Based on the simulation run by this study, the overall probability of fault slip is less than 10 % well into the future (2045), even with multiple high-volume injectors spaced roughly one mile apart. However, caution still needs to be exercised to avoid injection near unstable features.

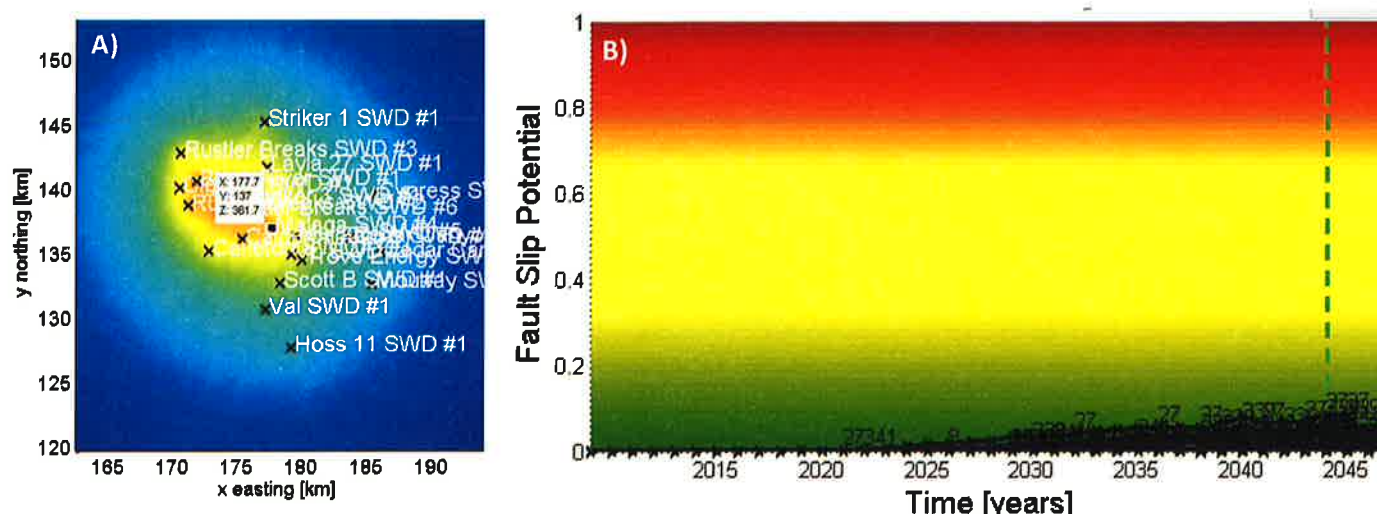

Figure 1: A) Modeled reservoir pressure for the 20 well case at year 2045. A maximum pressure of ~362 psi is observed at Malaga SWD #4. B) Fault slip potential (FSP) for the 20 well case. On all faults, FSP remains below 10%. The green dashed line marks year 2045, the black lines and numbers denote the slip probability of individual faults.

**APPLICATION OF BLACK RIVER WATER
MANAGEMENT COMPANY, LLC TO
AMEND ADMINISTRATIVE ORDER SWD-
1738 FOR MALAGA SWD NO. 4 WELL,
EDDY COUNTY, NEW MEXICO.**

CASE NO. 20933

AFFIDAVIT OF BRADLEY M. ROBINSON

I, Bradley M. Robinson, of lawful age and being first duly sworn, declares as follows:

1. My name is Bradley M. Robinson. I work for MRC Energy Company, an affiliate of Matador Production Company ("Matador"), as the Executive Vice President of Reservoir Engineering and Chief Technology Officer for MRC Energy and all of its affiliates. Black River Water Management Company, LLC ("Black River Water Management") is the applicant in this case and is an affiliated company.

2. I have previously testified before the New Mexico Oil Conservation Division as an expert witness in petroleum engineering. My credentials as an expert in petroleum engineering have been accepted by the Division and made a matter of record.

3. I am familiar with the application filed by Black River Water Management and have conducted an engineering study of the proposed changes to the Malaga SWD No. 4.

4. Black River Water Management seeks an amendment to Administrative Order SWD-1738 permitting it to increase the injection tubing size in the Malaga SWD No. 4 well from 4.5 inches to 5.5 inches. The tubing will be placed inside the 7.625-inch production casing. All other approved well designs and permit conditions under Administrative Order SWD-1738 will remain unchanged.

5. Exhibit C-1 is a well schematic of the Malaga SWD No. 4 well as-drilled, representing the well's current configuration. Exhibit C-2 is a well schematic of the Malaga SWD No. 4 well representing its proposed configuration with 5.5-inch injection tubing.

6. Prior engineering studies performed by me or under my direct supervision have shown that up to 85 percent of the surface injection pressure required to pump approximately 25,000 BWPD of water down the existing 4.5-inch tubing is from friction generated within the tubing, not a result of reservoir pressure or permeability in the Devonian formation. As a result, an increase in the tubing diameter will significantly reduce the surface injection pressure resulting from friction and will allow larger volumes of water to be injected at the same or lower surface injection pressures. Being able to dispose of more water using a larger diameter tubing means that we will ultimately drill fewer salt water disposal wells, which will reduce our surface footprint in the area.

7. Based on my familiarity with the target injection interval in the Devonian formation, my prior studies, and experience increasing injection tubing from 4.5 inches to 5.5 inches, it is my opinion that the increased injection rates and volumes that will result from an increase in tubing diameter will have a negligible effect on the overall reservoir pressure in the Devonian formation.

8. Also, based on my familiarity with the reservoir properties of the target injection interval in the Devonian formation, my prior studies evaluating the formation for injection, and experience overseeing the company's injection activities in New Mexico, it is my opinion that the Devonian formation has the capacity to accept the rates and volumes of salt water that will be injected through the Malaga SWD No. 4 as a result of the increased tubing size. The proposed increase in tubing diameter will not present a risk to freshwater sources in the area.

9. BLM guidelines provide for at least a 0.42-inch annular gap between the outer-diameter of the injection tubing and interior diameter of the production casing. With a 7.625-inch casing and 5.5-inch tubing, the effective gap will exceed BLM guidance and will provide adequate clearance to accommodate standard fishing and spearing tools.

10. Exhibit C-3 is a proposed plugging plan to be implemented in the event the tubing is irretrievably lost and the well must be abandoned. The second page of the exhibit is a well schematic that depicts a potential plugging configuration that might be implemented prior to final abandonment.

11. In my opinion, granting this application will help conserve resources, avoid waste, and protect correlative rights.

FURTHER AFFIANT SAYETH NOT.

Salt Water Disposal – Proposed Abandonment Procedure

Note: All abandonment procedures are subject to well conditions and NMOCD COA's. The proposed plan below is subject to change. Proposed procedure is written in accordance to 19.15 NMAC and NMOCD UIC Program Manual. This proposed procedure also references NMOCD District II / Artesia, NM "Conditions for Plugging and Abandonment" guide and is attached.

1. Notify NMOCD within 30 days after injection into wellbore has been discontinued.
2. Submit proposed plugging or temporary abandonment plan with current and planned wellbore diagrams to NMOCD for review and approval.
3. Notify NMOCD at least 24 hrs prior to start of operations.
4. Safety Mtg, MIRU, Kill Well, ND WH, NU BOPs, TOOH with injection tubing.
5. Set CIBP either 100' from top of injection zone or top of tubing, spot 35' CI 'H' cement plug with bailer, WOC 4 hrs and tag.
6. Set additional balanced cement plugs to surface no greater than 3,000' apart, spotting 25 sx or 100' minimum CI 'H' or CI 'C' depending on depth, WOC 4 hrs and tag.
7. Cut and pull 7-5/8" casing above TOC and continue setting formation isolation plugs per NMOCD.
8. Perforate and squeeze all casing shoes 50' below shoe depth, squeeze pressure not to exceed 500 psi.
9. Final casing shoe will be perforated and squeezed CI 'C' cement to surface.
10. Verify/Observe casing annulus filled with cement.
11. RDMO
12. Cut off wellhead and install above ground marker per NMOCD specifications.

Note: Mud laden fluid mixed at 25sx/100bbbls water will be spotted between each plug.
Class 'C' cement will be used above 7500'
Class 'H' cement will be used below 7500'
