

# Fruitland Coal Increased Density Pilot Project

## Outline of Reservoir Engineering Testimony

- Testimony will begin with a qualitative discussion of incremental recovery from increased density
- This will be followed by quantitative analyses
  - An evaluation of the combined performance of parent/increased density wells demonstrates a lack of interference to date
    - First a review at a high level (133 wells in T29N-R9W)
    - Then an examination at a localized level (23 wells in Pilot Project Area)
  - An analysis of Original Gas-in-Place data and overall recovery factors demonstrate poor yields within the Pilot Project Area based on current spacing
