

Fruitland Coal Increased Density Pilot Project

Current Spacing Results to Date in T29N-R9W

- Actual results from all Fruitland wells in T29N-R9W are depicted on the following graphs
 - These graphs portray the performance of 69 parent wells from inception
 - Also shown are the results of 64 increased density wells beginning June, 2003
 - The parent wells began a very modest current decline ($\sim 1\%$) in early 2007
- The 2nd graph shows a hypothetical decline that would result if 25% of the production from the increased density wells was captured from the parent wells
