GEOLOGICAL REPORT
TO SUPPORT THE THIRD ENLARGEMENT
OF THE INITIAL PARTICIPATING AREA
GALLEGOS CANYON UNIT
SAN JUAN COUNTY, NEW MEXICO

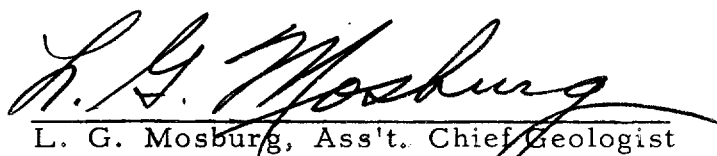

The Initial Pictured Cliffs Participating Area of the Gallegos Canyon Unit has been enlarged on two prior occasions due to proving additional acreage to be commercially productive. Completion of three wells capable of producing unitized substances in commercial quantities in Sections 5, 6, and 9, T-27-N, R-12-W, has necessitated a third enlargement to the Initial Participating Area. The proposed third enlargement will consist of the NW/4 of Section 5, the N/2 of Section 6, and the N/2 of Section 9. Pertinent data on the three wells which have been completed in this area as commercial producers subsequent to the establishment of the Initial Participating Area and the First and Second Enlargements are shown in the attached tabulation I.

In addition to the data shown on Tabulation I, which has to do with the specific wells concerned, a brief discussion of the Gallegos Canyon Unit Area and the West Kutz-Pictured Cliffs Field in general is presented to support adequately this enlargement to the Pictured Cliffs Participating Area of the Gallegos Canyon Unit. The Gallegos Canyon Unit is located in the northern portion of the West Kutz-Pictured Cliffs Field. In the West Kutz-Pictured Cliffs Field the productive zone is a lense-type sandstone found in the upper portion of the Pictured Cliffs formation. This sandstone is described lithologically as a tight, fine-grained salt and pepper sandstone with good porosity development but with a fair to poor development of permeability. The sand lense from which production is obtained bears little relationship to structure; hence a map contoured on top of the Pictured Cliffs formation has little significance with respect to determining the productive limits and therefore has not been prepared as a portion of this report. The limits of production in this sand lense are due entirely to a lack of permeability and porosity development within the sand zone. The trend of the productive area is northwest-southeast along the

strike of the regional dip of the Pictured Cliffs formation, with the top of the Pictured Cliffs being found generally between the depths of +4300' and +4500'.

These three wells which are proposed for inclusion in the Third Enlargement to the Initial Participating Area are near the southwestern limits of commercial production from the Pictured Cliffs zone. Their proximity to the productive limits is illustrated by the productivity of the three wells concerned. The average deliverability for these three wells is 236 MCFPD as compared to the average deliverability per well for the Gallegos Canyon Unit of 432 MCFPD. It has been recognized that deliverability is an indication of pay quality in the Pictured Cliffs formation. These three wells are commercial producers, however, as is indicated by their estimated allowables for the first proration period from March 1, 1955, through January 31, 1956, of from 101 to 152 MCFPD. Allowables of this magnitude indicate a payout period sufficiently attractive to justify classification of these wells as "capable of producing unitized substances in paying quantities" and thereby justify the inclusion of the acreage assigned to them in an enlargement to the Initial Participating Area.

Gentlemen:

Attached you will find for your files corrected Exhibits "A" of the recently approved Second, Third, and Fourth Enlargements of the Participating Area and the enlargement of the Unit Area for the Gallegos Canyon Unit. On the original Exhibits "A" furnished you, Wells 72 and 73 were incorrectly located. These corrected copies are being furnished to replace those presently in your files.

The Exhibits "A" transmitted to the working interest owners by our letter of April 20, 1956, File: E-534-416, were correct and your present file copies constitute the only incorrect copies which have been circulated.

Yours very truly,

STANOLIND OIL AND GAS COMPANY
