Pressure data on Edwards/Pondragon Chaco wells (P.C.) through mid-1997. Data is taken from NMOCD reports through 1984 and from Walsh Engineering field readings in 1995 - mid-1997. All are shut-in surface pressures. In the 1995-'97 period, readings where tubing and casing SIPs were equal are presented.

Note that the before-frac readings for the Chaco 4 and the un-frac'd and before-acidizing readings for the 1J and 2J are in the 140 psi-190 psi range in early 1995 - much higher than the previously available readings in 1983-'84. The Chaco 1 and Chaco 5 1995 pressures fall within the same range.

Subsequent readings for 1997 and 1998 are shown on the accompanying chart of pressure vs. calendar data.
