RE: 2012 Annual Report – former Giant Bloomfield Refinery.

Federal Express Tracking #: 7995 1279 3627

Dear Mr. Von Gonten;

Please find enclosed the 2012 Annual Report for the former Giant Bloomfield Refinery located in the NW ¼ of Section 27 and the SW ¼ of Section 22, Township 29 N, Range 12 W in San Juan County, New Mexico.

If you should have any questions or require additional information, please do not hesitate to contact me at 505-632-4171 or at Randy.Schmaltz@wnr.com.

Sincerely,

James R. Schmaltz
Health, Safety, Environmental & Regulatory Director

EXECUTIVE SUMMARY

LT Environmental, Inc. (LTE) on behalf of Western Refining Southwest, Inc. (Western) has prepared this report detailing work completed from January through December 2012 at the former Giant Bloomfield Refinery (Site) in Bloomfield, New Mexico. The scope of work for this project was continued recovery and monitoring of petroleum hydrocarbon impacts to groundwater, which were identified upon cessation of refinery operations. During the time period covered in this report, Western utilized a groundwater recovery and remediation system consisting of groundwater recovery wells, a carbon filtration unit, and a treated water infiltration trench.

LTE conducted operations and maintenance on the remediation system and monitored groundwater quality during 2012. In 2012, the total volume of groundwater recovered and treated increased from the volume observed in 2011 by 267,375 gallons to a total of 1,718,998 gallons.

LTE measured depth-to-groundwater in all monitoring wells and recovery wells quarterly and recovered phase-separated hydrocarbons (PSH) in monitoring wells with oil absorbent socks when PSH was detected weekly. Thin accumulations of PSH exist in previously identified source areas. A total of 17.32 gallons of PSH were recovered from the Site in 2012; a significant increase from the 7.03 gallons recovered in 2011. The increased volume of PSH recovered in 2012 can be attributed to a full year of weekly PSH recovery activities. Western increased the frequency of PSH recovery activities to weekly beginning in August 2011. Additionally, monitoring wells SHS-2 and SHS-8 contained detectable PSH for the first time since 2004. A 4-inch product recovery well, GBR-34A, was installed to enhance PSH recovery at the Site.

LTE sampled the remediation system influent and effluent quarterly for laboratory analysis of volatile organic compounds (VOCs) and general water chemistry. In addition, the system effluent was analyzed for polynuclear aromatic hydrocarbons (PAHs) and metals on an annual basis. Annual sampling in January 2012 included collecting groundwater samples from eleven monitoring wells and two recovery wells for laboratory analysis of VOCs and general water chemistry. Six of the groundwater samples were also analyzed for PAHs and four were analyzed for total metals concentrations.

Laboratory analytical results indicated no VOCs or PAHs were detected in influent and effluent groundwater samples, and groundwater samples collected from monitoring and recovery wells did not contain concentrations of VOCs or PAHs exceeding New Mexico Water Quality Control Commission (NMWQCC) standards. Sulfate concentrations exceeded NMWQCC standards in samples collected from twelve of the 13 monitoring and recovery wells and from the influent and effluent. Total dissolved solids exceeded NMWQCC standards in groundwater samples collected from all thirteen monitoring and recovery wells and from the influent and effluent. Chloride concentrations exceeded the NMWQCC standard in groundwater samples collected from two upgradient monitoring wells and one on-site monitoring well. The influent and nine of the thirteen monitoring and recovery wells contained manganese in excess of NMWQCC standards. Downgradient monitoring well SHS-8 contained fluoride concentrations in excess of NMWQCC standards. Iron concentrations exceeded the NMWQCC standard in nine of the thirteen monitoring and recovery wells. Chromium, selenium, and nickel concentrations exceeded NMWQCC standards in upgradient monitoring wells. These parameters can be attributed to an upgradient release at the Lee Acres Landfill in 1985 or to naturally occurring background conditions.

Based on the results presented in this report, Western will continue PSH recovery and operation of the remediation system. Western will continue quarterly monitoring of groundwater flow behavior, as well as influent and effluent sampling and laboratory analysis. Annual sampling of monitoring wells and recovery wells will continue.

1.0 INTRODUCTION

LT Environmental, Inc. (LTE) prepared this report on behalf of Western Refining Southwest, Inc. (Western) to summarize work completed from January through December 2012 at the former Giant Bloomfield Refinery (Site) in Bloomfield, New Mexico.

1.1 SITE DESCRIPTION

The Site is on the northeast corner of United States (U.S.) Highway 64 and County Road 3500, approximately five miles west of Bloomfield, New Mexico, in the southwest quarter of Section 22 and, the northwest quarter of Section 27 Township 29 North, Range 12 West in San Juan County, New Mexico (Figure 1). The remediation system includes a control building, aboveground storage tanks, two carbon filtration tanks, an infiltration trench, groundwater monitoring wells, and groundwater recovery wells (Figure 2).

1.2 SITE HISTORY

The former refinery, under ownership of Giant Industries, Arizona (Giant), produced leaded and unleaded gasoline, diesel, kerosene, and other refined petroleum products from 1974 to 1982 and is presently inactive. The refining operations and subsequent truck loading and unloading activities impacted groundwater, which were identified and investigated as part of the site closure requirements in 1986 prescribed by the New Mexico Oil Conservation Division (NMOCD). Details of a subsurface investigation and initial remediation efforts are contained in a 1987 report entitled *Soil and Groundwater Investigations and Remedial Action Plan, Giant Industries, Inc. Bloomfield Refinery, Bloomfield, New Mexico.* The investigation identified three source areas (Figure 2):

- Northern Area (Diesel Spill Area): 10,000 to 15,000 gallons of diesel were released from a pipeline in 1985;
- Central Area (Truck Fueling Area): 15,000 gallons of diesel were released from a pipeline in 1986; and
- Southern Area: Historical releases from a former fire fighting drill area east and upgradient of the Site may have collected in a former seep and a stormwater catchment area.

Concurrent with refinery operations, the former Lee Acres Landfill located upgradient of the Site operated as a San Juan County landfill from 1962 to 1986 (Figure 1). Landfill operations included solid waste disposal in trenches, and a series of lagoons that were used for disposal of a variety of liquid wastes. The NMOCD sampled the lagoons in 1985 and demonstrated that the liquids in the impoundments contained a variety of chlorinated solvents, petroleum hydrocarbon constituents, heavy metals, and salts. In April 1985, a breach in the dike retaining the lagoons released liquid wastes into an arroyo west of the Site. The arroyo drains south toward the Lee Acres Subdivision, where the NMOCD and the New Mexico Environment Department (NMED) identified impacted groundwater in domestic water wells in 1988. In response, the NMOCD required Giant to investigate petroleum hydrocarbon impacts to groundwater downgradient of

the refinery in the Lee Acres Subdivision, and the NMED conducted a separate investigation to identify potential impacts from the landfill. The results of the subsurface investigation conducted by Giant south of the refinery are contained in three volumes of the 1992 report, *Remedial Investigation Report for Lee Acres Landfill*. The NMED in conjunction with the Bureau of Land Management and the United States Geological Survey published their results in three reports referenced in Section 6.0 of this report.

The investigations identified two separate plumes of impacted groundwater that commingled across the refinery and flowed downgradient into the Lee Acres Subdivision. Groundwater contaminants detected in the refinery plume included phase-separated hydrocarbons (PSH) and dissolved phase petroleum hydrocarbons. The dissolved-phase constituents included benzene, toluene, ethylbenzene, and total xylenes (BTEX), naphthalene, and 1,2 dichloroethane (EDC). The landfill contaminant plume contained total dissolved solids (TDS), chloride, sulfate, manganese, metals, BTEX, naphthalene, 1,1 dichloroethane, cis-1,2-dichloroethene, trans-1,2-dichloroethene, tetrachloroethene, 1,1,1-trichloroethane, and trichloroethene.

Beginning in 1988, Giant installed a groundwater recovery, treatment, and disposal system in stages at the Site to restrict migration of contaminants and to remediate groundwater impacts caused by Giant's operations. A total of 45 monitoring wells were initially installed and designated GBR wells (Figure 2). Of these 45 monitoring wells, 11 were converted to recovery wells and re-named with GRW designations. An additional 17 monitoring wells were completed in the Lee Acres Subdivision and designated as SHS wells. Four SHS wells initially operated as recovery wells. Giant pumped groundwater from the recovery wells into storage tanks, then treated the groundwater with an air stripper and carbon filtration and re-injected treated groundwater into the subsurface through two infiltration galleries.

As groundwater quality improved over time, the remediation system was gradually simplified. It currently consists of 9 active groundwater recovery wells that pump groundwater into a single storage tank (Tank 102). Groundwater from Tank 102 is pumped to a carbon filtration tank, and then passes through a treated water infiltration trench (Figure 2). Following initial contaminant reduction, the groundwater remediation system has operated in an operation and maintenance mode. Concentrations of contaminates within the remediation system's influent and effluent were below laboratory detection limits for 18 years. In 2008, Western conducted a supplemental evaluation of the remedial operations, which included shutting down the remediation system and sampling groundwater wells under static conditions in an effort to redefine the area of impact and assess effectiveness of the remediation system. Existing equipment was inspected and repaired to optimize performance. Results from the sampling event were included in the 2008 annual report submitted to the NMOCD. Pumping and treating operations were resumed in February 2009 and continued through 2012.

1.3 SITE HYDROLOGY

The Site is located on weathered outcrops of the Nacimiento Formation, which is comprised of shales, sandstones, and siltstones of Cretaceous-Teritary age. The San Juan River is approximately 2,000 feet south of the Site. Immediately west is a large unnamed arroyo, which is underlain by 30 feet to 60 feet of Quaternary alluvial sediments. Older Quaternary terrace deposits of cobbles and boulders were observed on the interfluvial ridges adjacent to the arroyo.

These terrace deposits may have been utilized as fill on the Site. The outcropping surfaces of the Nacimiento Formation have been eroded to form a paleo-channel that appears to be similar in morphology to the existing surface arroyo located to the west. The bedrock is overlain by recent alluvial deposits (gravel, sand, silt, and clay), which thicken toward the south-southwest as illustrated on the cross section on Figure 3.

The subsurface geology is a controlling feature for groundwater flow direction and contaminant migration. Shallow groundwater is generally unconfined with some local areas potentially under semi-confined conditions. There are two aquifers of concern that are in direct hydraulic communication: a shallow aquifer composed of recent alluvial materials and a bedrock aquifer that exists in the underlying Nacimiento Formation (Figures 3 and 4, respectively). The alluvial aquifer generally has the higher permeability of the two aquifers, and recovery wells completed within this aquifer have higher yields with larger radii of influence.

1.4 SCOPE OF WORK

The scope of work for this project included operating and maintaining the groundwater remediation system, monitoring groundwater quality and presence of PSH, and recovering PSH. A summary of field activities, results, conclusions, and recommendations are presented in the subsequent sections of this report.

2.0 METHODOLOGY

2.1 GROUNDWATER REMEDIATION SYSTEM

The groundwater remediation system at the Site was designed to pump impacted groundwater from local aquifers through a series of recovery wells, which prevent migration of impacted groundwater beyond the influence of the wells as illustrated on Figure 5. The recovered groundwater is collected in Tank 102 then pumped to a second tank with a carbon matrix lining where it is treated by carbon adsorption. The treated water is then returned to the aquifer through an infiltration trench. The infiltration trench consists of a subsurface system of perforated polyvinyl chloride (PVC) pipes placed within gravel packs. Water infiltrates the surrounding strata and eventually returns to the aquifer. The return of recovered water to the aquifer acts as a recharge mechanism. Figure 6 is a simplified diagram representation of the groundwater recovery, treatment, and disposal system at the Site.

2.2 OPERATIONS AND MAINTENANCE

LTE conducted weekly inspections to ensure normal operation of the remediation system. A panel located in the control building controls operation of the remediation system and incorporates shutdown functions to safeguard against a tank overflow and other undesirable events. The control panel was monitored weekly, as were water flow meters at the storage tank and each recovery well. Weekly observations were recorded in a bound field log book with the date, time, and person recording the information noted. Water flow meter readings were entered into a spreadsheet to calculate flow volumes and monitor cumulative flow rates. All equipment at the Site was inspected for leaks and malfunctions. The inspector was familiar with the location of underground lines and noted any surface indication of underground leaks.

Maintenance included repair and replacement of well pumps, pump controllers, and flow meters. Additionally, LTE replaced filters in well houses on a regular basis, inspected the carbon pre-filter, and repaired any other hardware as necessary.

2.3 PSH RECOVERY

Oil absorbent socks were used to passively recover PSH detected in groundwater monitoring wells at the Site. The socks were monitored weekly from January through December and replaced when they were greater than 50 percent full. Volumes of recovered PSH were estimated based on percent saturation observed in the socks and were recorded in a field log book. In addition, LTE and Western manually recovered PSH from GBR-34 and SHS-2 when present with disposable bailers weekly.

2.4 GROUNDWATER MONITORING

Quarterly groundwater monitoring included measurements of depth to groundwater at all monitoring and recovery wells with a Keck oil-water interface probe. The interface probe was decontaminated with Alconox™ soap and rinsed with de-ionized water before each measurement. Depth to groundwater measurements were used to calculate quarterly groundwater elevations at the Site to determine direction of groundwater flow and hydraulic control achieved

by the recovery wells. The recovery pumps were not turned off during quarterly monitoring events nor were the pumps removed from the recovery wells; therefore, calculated groundwater elevations do not represent static conditions.

Influent and effluent groundwater samples were collected quarterly and analyzed for general water chemistry parameters including pH, electrical conductivity (EC), TDS, alkalinity, hardness, anions (bromide, chloride, sulfate, fluoride, nitrite, nitrate, and phosphate), and cations (calcium, iron, magnesium, manganese, potassium, and sodium) and for volatile organic compounds (VOCs) using United States Environmental Protection Agency (USEPA) Method 8260B. The effluent groundwater sample was also analyzed annually for polynuclear aromatic hydrocarbons (PAHs) according to USEPA Method 8310 and total metals (barium, beryllium, cadmium, chromium, copper, nickel, silver, zinc, antimony, arsenic, selenium, and thallium) according to USEPA Method 200.7 and 200.8, and mercury according to USEPA Method 245.1. Influent groundwater was collected from a system valve before it entered the carbon filtration unit. Effluent groundwater was collected through a sample valve as treated water exited the carbon adsorption tank. Groundwater samples were collected in appropriate pre-cleaned and/or pre-preserved sample bottles or glass vials. Samples were labeled with the date and time of collection, sample designation, project name, collector's name, and parameters to be analyzed and immediately sealed and packed on ice. The samples were shipped on ice following strict chain-of-custody procedures to Hall Environmental Analysis Laboratory (HEAL) in Albuquerque, New Mexico, before designated holding times expired.

LTE collected annual groundwater samples from groundwater monitoring wells and recovery within and south of the Site (Table 1). The volume of groundwater in the monitoring wells was calculated, and a minimum of three well casing volumes of groundwater was purged from each well using a disposable bailer. As groundwater was extracted, pH, EC, and temperature were monitored. Monitoring wells were purged until these properties stabilized or the well bailed dry, indicating the purge water was representative of aquifer conditions. Stabilization was defined as three consecutive stable readings for each water property (±0.4 units for pH, ±10 percent for electric conductivity, and ±2° Celsius for temperature). Once each monitoring well was properly purged, groundwater samples were collected in bottles or vials and shipped to HEAL. Groundwater sampling from recovery wells followed the same procedures as monitoring wells, except pumps installed in recovery wells were used to purge the appropriate volume of groundwater from each recovery well. The groundwater samples were analyzed for VOCs according to USEPA method 8260B and general water chemistry parameters including pH, EC, TDS, alkalinity, hardness, anions (bromide, chloride, sulfate, fluoride, nitrite, nitrate, and phosphate), and cations (calcium, iron, magnesium, potassium, and sodium). Six of the groundwater samples were analyzed for PAHs according to USEPA Method 8310 and four groundwater samples were analyzed for total metals (barium, beryllium, cadmium, chromium, copper, lead, nickel, silver, zinc, antimony, arsenic, selenium, and thallium) according to USEPA Method 200.7 and 200.8, and mercury according to USEPA Method 245.1.

3.0 RESULTS

3.1 OPERATIONS AND MAINTENANCE

LTE and Western worked concurrently to keep the groundwater remediation system fully operational. Repairs and observations included:

- Western removed the housing and pump in GRW-12 and airlifted sediment from the well between February 8 and February 21, 2012. Pump maintenance decreased as a result;
- Western removed the pumps in GRW-4, GRW-5, and GRW-6 on February 21, 2012, for inspection after observing low pumping volumes. The pump in GRW-4 was reinstalled on March 1, 2012, after being cleaned. The pumps in GRW-5 and GRW-6 were cleaned, reinstalled, and put back into service on March 23, 2012. The cleaning of the pumps improved recovery volumes;
- The pump in GRW-13 was replaced on March 26, 2012. The pump was down for less than a week during maintenance;
- On April 11, 2012, the filter housing on GRW-5 snapped at the threads. Between April 5 and April 18, 2012, the above ground piping and filter housings were replaced in GRW-5 and in GRW-6 as a precautionary measure;
- On April 18, 2012, Western replaced the pump motor control on GRW-11. The pump was down for less than one week during maintenance;
- The pump in GRW-6 was lowered three feet on April 25, 2012, in an attempt to increase the volume of groundwater recovered. Recovery volumes increased as a result;
- Western replaced the surface piping on GRW-3 on May 16, 2012, after leaking water was discovered;
- GRW-3 had electrical problems and was taken out of service on July 25, 2012, at which time the motor in the pump was replaced with a new 115 volt motor. Replacing the motor did not fix the problem; an electrician was hired to repair the pump. The well was put back into service on November 3, 2012;
- Sometime between July 2012 and October 2012, SHS-13 was run over with a car. The concrete housing has been shifted over the top of the well, making it inaccessible; and
- No surface indications of underground leaks were observed in 2012.

Except for GRW-4, GRW-5, and GRW-11, the recovery wells pumped larger volumes of groundwater in 2012 as compared to 2011. In 2012, GRW-4, GRW-5, and GRW-11 had a lower

weekly average of gallons pumped by 281 gallons, 609 gallons, and 1,397 gallons, respectively. Mechanical problems with pumps required extensive down time. Table 2 presents the total volume of groundwater pumped from each recovery well during 2011 and 2012. A total of 1,718,998 gallons of groundwater were recovered and treated by carbon filtration in 2012, representing an increase from the 1,451,623 gallons of groundwater treated during 2011.

3.2 GROUNDWATER ELEVATION

Groundwater elevations measured in groundwater monitoring and recovery wells are presented in Table 3 and quarterly potentiometric surface maps are depicted on Figures 7 through 10. When PSH is detected, the groundwater elevation is corrected using an estimated density correction factor of 0.88. Groundwater flow direction was consistently toward the southwest throughout the year. Drawdown around recovery wells is evident each quarter. Groundwater elevations in most wells were lower during 2012 than in the past, which is a regional trend resulting from the ongoing drought.

3.3 PSH RECOVERY

Thin accumulations of PSH were detected in groundwater monitoring wells near the source areas identified in the preliminary subsurface investigation conducted by Giant. Oil-absorbent socks were installed and maintained in monitoring wells GBR-7, GBR-8, GBR-11, GBR-20, GBR-22, GBR-23, GBR-25, GBR-26, GBR-34, and product recovery well GBR-34A during 2012 (Figure 11). Annual volumes of PSH recovered from 2009 through 2012 are presented in Table 4. More than two times the amount of PSH was recovered in 2012 as compared to 2011.

In the Northern Area, LTE did not detect measurable PSH in GBR-23, GBR-25, and GBR-26 in 2012, but approximately 1.7 gallons of PSH were recovered with oil absorbent socks during the year.

In the Central Area, LTE regularly detected and recovered PSH in GBR-34. The thickness of PSH in GBR-34 was as high as 0.74 feet in April 2012. A total of 10.1 gallons of PSH was removed from GBR-34 using oil-absorbent socks and manual bailing. The cross sections depicted on Figures 3 and 4 indicate a small depression in the groundwater table at GBR-34 that may be controlling PSH accumulations at this location. LTE removed a total of 2.2 gallons of PSH from GBR-22 during 2012 using oil-absorbent socks.

Western installed GBR-34A on February 10, 2012, as a 4-inch product recovery well to increase efficiency of product recovery in the Central Area. GBR-34A was installed adjacent to GBR-34, which regularly contains the largest volume of PSH at the Site. PSH was detected in GBR-34A once in 2012; 0.02 feet was measured on May 8, 2012. In an attempt to adequately develop GBR-34A and to draw PSH into the well, LTE bailed the well dry weekly by removing approximately 9 to 14 gallons of groundwater. Multiple purge events did not result in greater PSH accumulations and did not appear to impact the volume of PSH accumulating in GBR-34. A 4-inch diameter oil-absorbent sock was installed on June 14, 2012, and replaced when PSH saturated more than 50% of the sock. A total of 0.98 gallons of PSH were recovered from GBR-34A.

In the Southern Area, no PSH was detected in GBR-7, GBR-8, GBR-11, or GBR-20 during 2012. LTE continued to recover small volumes of PSH in oil absorbent socks throughout the year. A total amount of 2.29 gallons of PSH were recovered from the Southern Area.

For the first time since October 2004, PSH was discovered in groundwater monitoring wells south of Highway 64. SHS-2 and SHS-8 contained 0.01 feet of PSH on October 4, 2012. LTE measured depth to water in the surrounding monitoring wells weekly for the remainder of 2012 to observe the behavior of the PSH.

3.4 GROUNDWATER SAMPLING

Laboratory analytical results from groundwater sampling are presented in Table 5 and the complete laboratory analytical reports are in Appendix A. Isopach maps and geologic cross sections illustrating the distribution of analytes are not included because the sampling events do not include wells from all of the current source areas. Such a presentation of results would not be indicative of actual conditions at the Site. Laboratory analytical results from 2012, as compared to NMWQCC standards are summarized below:

- No VOCs exceeded laboratory detection limits in influent or effluent samples;
- VOCs were detected in the annual groundwater samples, but only in minor concentrations that did not exceed NMWQCC standards:
    - EDC was detected in groundwater from monitoring well GBR-24D;
    - Tetrachloroethene (PCE) was detected in groundwater in upgradient monitoring wells GBR-32, GBR-48 and GBR-49;
    - Acetone was detected in groundwater from monitoring well SHS-8;
- Concentrations of PAHs were not detected above the respective laboratory limits in samples collected from the system effluent or from samples collected the groundwater monitoring and recovery wells;
- Except in groundwater in SHS-8, sulfate concentrations exceeded the NMWQCC standard in samples collected from the groundwater monitoring and recovery wells, system influent, and system effluent;
- TDS exceeded the NMWQCC standard in samples collected from the groundwater monitoring and recovery wells, system influent, and system effluent;
- Chloride concentrations exceeded the NMWQCC standard in groundwater samples collected from up-gradient wells GBR-32, and GBR-49, and at GBR-30;
- The total chromium concentration in groundwater from GBR-48 exceeded the NMWQCC standard. GBR-48 is located within the arroyo adjacent to and upgradient of the Site;

- Iron concentrations exceeded the NMWQCC standard in the annual groundwater sample from GRW-3, GBR-17, GBR-24D, GBR-30, GBR-31, GBR-48, GBR-51, GBR-52, and SHS-8;

- Manganese was detected in concentrations exceeding the NMWQCC standard in annual groundwater samples from GRW-3, GRW-6, GBR-24D, GBR-30, GBR-31, GBR-32, GBR-48, GBR-49, SHS-8, and from the influent sample;

- The concentration of fluoride exceeded the NMWQCC standard in groundwater collected from monitoring well SHS-8;

- The concentration of nickel exceeded the NMWQCC standard in groundwater collected from upgradient monitoring well GBR-49;

- The concentration of selenium exceeded the NMWQCC standard in groundwater from upgradient monitoring wells GBR-32 and GBR-48.

4.0 CONCLUSIONS

Western successfully maintained the groundwater remediation system at the Site and continued to recover residual PSH from original source areas. The volume of groundwater recovered at the Site increased due to ongoing maintenance of the remediation system.

Measurable PSH near the previously identified sources at the Site has decreased in 2012 compared to 2011. The presence of PSH south of Highway 64 is most likely residual PSH that was trapped in the smear zone near the monitoring wells and exposed as groundwater elevation decreased as a result of ongoing drought conditions. Figure 12 depicts the groundwater elevations in wells SHS-2 and SHS-8 from 2009 to 2012. Groundwater elevations measured before 2009 were not included due to the inconsistency caused from pumping in nearby recovery wells. A decreasing trend is evident in 2012 and groundwater elevation measured in 2012 represents the lowest elevations measured. Continued frequent monitoring will aid in determining how to address the PSH.

Contaminants of concern were either not detected in groundwater samples or, if detected, can be attributed to an upgradient source or naturally occurring background conditions. The influent and effluent groundwater associated with the remediation system at the Site did not contain detectable concentrations of VOCs or PAHs during 2012, and groundwater samples collected from monitoring and recovery wells did not contain VOCs or PAHs exceeding NMWQCC standards.

Influent and effluent water associated with the pump and treat system at the Site is consistently compliant with standards for general chemistry parameters and metals, with the exception of TDS, chloride, and sulfate. Elevated sulfate, chloride, and TDS are historically characteristic of groundwater at the Site and are most likely related to a release at the Lee Acres Landfill in 1985. These analytes were identified in earlier studies as constituents within the groundwater contaminant plume that originated from the landfill. Previous investigations at the landfill reported elevated levels of chloride present in the water sampled from liquid waste lagoons (McQuillan, D. and Longmire, P., *Water Quality Investigations at the Lee Acres Landfill and Vicinity, San Juan County, New Mexico*), and the landfill accepted produced water from natural gas well operations in the San Juan Basin. During initial landfill investigations, the upgradient area near GBR-32, GBR-48, GBR-49, and GBR-50 was identified as the "northern containment slug." Groundwater representative of this area contained TDS concentrations ranging from 2,125 milligrams per kilogram (mg/kg) to 6,068 mg/kg, sulfate concentrations ranging from 1,920 mg/kg to 5,830 mg/kg, and chloride concentrations ranging from 14.7 mg/kg to 2,110 mg/kg (Roy F. Weston, Inc., *Remedial Investigation Report for Lee Acres Landfill, Volume 1*).

Heavy metals, including chromium, iron, manganese, nickel, and selenium were detected in upgradient monitoring wells during the annual sampling in January 2012. Additionally, iron and manganese concentrations exceeded NMWQCC standards in on-site wells. Previous studies conducted for the Lee Acres Landfill identified chromium, iron, manganese, nickel, and selenium in groundwater sampled upgradient of the landfill. *The Remedial Investigation Report for Lee Acres Landfill, Volume 1* states that the upgradient background alluvial aquifer contains

elevated levels of chromium and manganese and suggests an unidentified source that is unrelated to the landfill or the Site.

5.0 RECOMMENDATIONS

Western will continue to operate the remediation system and monitor groundwater as described in this report, including the activities below:

- Operate and maintain the remediation system to prevent migration of PSH;
- Use oil absorbent socks to recover PSH and monitor PSH weekly, replacing socks as needed;
- Monitor groundwater flow behavior quarterly by measuring depth to groundwater;
- Sample the system influent and effluent quarterly; and
- Sample groundwater monitoring and recovery wells annually, including SHS-8 south of the Site, to identify potential changes in water quality.

Notes:
BTOC - below top of casing
D - designates the well screen is deep
GWEL - groundwater elevation
PSH - phase-separated hydrocarbon
S - designates the well screen is shallow
* Top-of-casing elevation is unknown
** Well is damaged by a tree root
*** Well was paved over in June 2010
Ŧ Indicates that water level was below groundwater pump
† Product Recovery socks in well, groundwater and product levels are not static
- indicates no GWEL or PSH measured
◊ Well damaged by a car
∞ Car on blocks parked over well
When PSH is detected, the GWEL is corrected using an estimated density correction factor of 0.88.

RE: GBR OrderNo.: 1201592

Dear Ashley Ager:

Hall Environmental Analysis Laboratory received 6 sample(s) on 1/20/2012 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative. Analytical results designated with a "J" qualifier are estimated and represent a detection above the Method Detection Limit (MDL) and less than the Reporting Limit (PQL). These analytes are not reviewed nor narrated as to whether they are laboratory artifacts.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

RE: GBR OrderNo.: 1201460

Dear Kelly Robinson:

Hall Environmental Analysis Laboratory received 9 sample(s) on 1/17/2012 for the analyses presented in the following report.

There were no problems with the analytical events associated with this report unless noted in the Case Narrative. Analytical results designated with a "J" qualifier are estimated and represent a detection above the Method Detection Limit (MDL) and less than the Reporting Limit (PQL). These analytes are not reviewed nor narrated as to whether they are laboratory artifacts.

Quality control data is within laboratory defined or method specified acceptance limits except if noted.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

RE: GBR OrderNo.: 1204A78

Dear Ashley Ager:

Hall Environmental Analysis Laboratory received 1 sample(s) on 4/28/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

RE: GBR OrderNo.: 1204286

Dear Ashley Ager:

Hall Environmental Analysis Laboratory received 3 sample(s) on 4/6/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

RE: GBR OrderNo.: 1207B48

Dear Ashley Ager:

Hall Environmental Analysis Laboratory received 2 sample(s) on 7/26/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

RE: GBR OrderNo.: 1210345

Dear Ashley Ager:

Hall Environmental Analysis Laboratory received 3 sample(s) on 10/5/2012 for the analyses presented in the following report.

This report is a revised report and it replaces the original report issued October 17, 2012.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

Total Alkalinity (as CaCO3)	390	20	80.00	318.3	85.7	59.9	111	0.217	10	

Qualifiers:

- * Value exceeds Maximum Contaminant Level.
- E Value above quantitation range
- J Analyte detected below quantitation limits
- P Sample pH greater than 2
- B Analyte detected in the associated Method Blank
- H Holding times for preparation or analysis exceeded
- ND Not Detected at the Reporting Limit
- R RPD outside accepted recovery limits

QC SUMMARY REPORT

Hall Environmental Analysis Laboratory, Inc.

WO#: **1210345**

24-Oct-12

Client: Western Refining Southwest, Inc.

Project: GBR

Sample ID **MB-4215**	SampType: **MBLK**	TestCode: **SM2540C MOD: Total Dissolved Solids**
Client ID: **PBW**	Batch ID: **4215**	RunNo: **6151**
Prep Date: **10/9/2012**	Analysis Date: **10/11/2012**	SeqNo: **177213** Units: **mg/L**

Analyte	Result	PQL	SPK value	SPK Ref Val	%REC	LowLimit	HighLimit	%RPD	RPDLimit	Qual
Total Dissolved Solids	ND	20.0

Sample Log-In Check List

Client Name: Western Refining Southwest, Inc Bloomfield Work Order Number: 1210345

Received by/date: LM 10/05/12

Logged By: Michelle Garcia 10/5/2012 10:10:00 AM Michelle Garcia

Completed By: Michelle Garcia 10/5/2012 11:00:37 AM Michelle Garcia

Reviewed By: MS 10/05/12

Chain of Custody

1. Were seals intact?	Yes ☐	No ☐	Not Present ☑
2. Is Chain of Custody complete?	Yes ☑	No ☐	Not Present ☐
3. How was the sample delivered?	Courier		

Log In

4. Coolers are present? (see 19. for cooler specific information)	Yes ☑	No ☐	NA ☐
5. Was an attempt made to cool the samples?	Yes ☑	No ☐	NA ☐
6. Were all samples received at a temperature of >0° C to 6.0°C	Yes ☑	No ☐	NA ☐
7. Sample(s) in proper container(s)?	Yes ☑	No ☐	
8. Sufficient sample volume for indicated test(s)?	Yes ☑	No ☐	
9. Are samples (except VOA and ONG) properly preserved?	Yes ☑	No ☐	
10. Was preservative added to bottles?	Yes ☐	No ☑	NA ☐
11. VOA vials have zero headspace?	Yes ☑	No ☐	No VOA Vials ☐
12. Were any sample containers received broken?	Yes ☐	No ☑	
13. Does paperwork match bottle labels? (Note discrepancies on chain of custody)	Yes ☑	No ☐	
14. Are matrices correctly identified on Chain of Custody?	Yes ☑	No ☐	
15. Is it clear what analyses were requested?	Yes ☑	No ☐	
16. Were all holding times able to be met? (If no, notify customer for authorization.)	Yes ☑	No ☐	

001C, 002C - ADDED 1mL HNO_3 FOR ACCEPTABLE pH - MS 10/05/12

# of preserved bottles checked for pH: 4 (<2 or >12 unless noted)

Adjusted? 4

Checked by: MS

Special Handling (if applicable)

17. Was client notified of all discrepancies with this order? Yes ☐ No ☐ NA ☑
