# Pit Excavation 6/22/12

June 22, 2012 File No.: 122078.3-ALB12RP001

Mr. Jim Griswold New Mexico Oil Conservation Division 1200 South St. Francis Drive Santa Fe, New Mexico 87505

#### Subject: Report of Remediation of a Former Reserve Pit North Lea Joint Venture Site Crossroads, New Mexico

Dear Mr. Griswold:

Kleinfelder West, Inc. (Kleinfelder) is pleased to submit this report to the New Mexico Oil Conservation Division (NMOCD) regarding the remediation of a former reserve pit located at the above referenced property (the "Site"). The Site is located approximately 2 miles northwest of Crossroads, New Mexico (see Figure 1, Site Location Map). The Site consisted of an abandoned crude oil pit (see Figure 2, Site Plan). Features at the Site included:

- A former reserve pit that was approximately 80 feet by 80 feet (ft) in size. The former reserve pit was surrounded by an earthen berm that was approximately 4 to 6 ft high and approximately 20 ft wide;
- The former reserve pit was surrounded by a barbed-wire fence;
- A ground water monitoring well was located near the southeastern corner of the fence; and
- A petroleum-stained soil area that was located to the southwest of the fence.

Photographs documenting site conditions are included in Appendix A. The property is privately owned by Mrs. Kileen Bresenham. An access agreement, provided by the NMOCD, was signed by Mrs. Brensenham prior to the start of field work.

# **Project History**

A limited Phase II Environmental Site Assessment (Phase II) was performed at the site in January 2012. The Phase II consisted of advancing three borings at the Site to assess the horizontal and vertical profile of total petroleum hydrocarbon (TPH) and chloride concentrations. The first boring was drilled within the former reserve pit in an area where the berm was removed. Two additional (lateral) borings were drilled northeast and southeast of the corners of the former reserve pit.

The results of the Phase II indicated the following:

• Concentrations of TPH appeared to have migrated vertically, but not horizontally since they were not detected in the soil samples collected from the lateral borings; and

122078.3-ALB12RP001 Copyright 2012, Kleinfelder • Concentrations of chlorides appear to have migrated vertically as well as horizontally at depth.

The observed TPH and chloride concentrations were most likely caused by the migration of meteoric waters through the former reserve pit material and into the subsurface. The analytical results from the pit sample did not indicate the presence of volatile organic compounds or the presence of gasoline-range TPH. This may be the result of degradation and volatilization of these compounds due to the age of these materials.

Soil samples were collected in March 2012 for the analysis of naturally occurring radioactive materials (NORM). Results of these samples indicated that concentrations are below regulatory limits. Laboratory analytical reports are included in Appendix B.

#### **Project Preparation**

Prior to project mobilization, a work plan was prepared and submitted for approval to the NMOCD. Upon receiving authorization to proceed from the NMOCD, Kleinfelder performed the following:

- Developed a Site Specific Health and Safety Plan (SSHASP) that addressed field work specified in the Work Plan (included in Appendix C);
- Developed work orders for the subcontractor;
- Notification to the New Mexico One-Call to facilitate location of underground utilities and pipelines was performed by the subcontractor (One Call Ticket number 2012202901); and
- Notified the NMOCD and the property owner a minimum of 48 hours prior to the commencement of remediation activities.

# Field Program

The subcontractor selected to perform the field work was EnviroWorks, LLC., of Edgewood, New Mexico. Kleinfelder and subcontractor employees mobilized to the site on May 21, 2012. Prior to the start of field activities, a project kickoff meeting was performed that included reviewing the SSHASP, applicable Job Safety Analyses, and stop work authority (SWA). Tailgate safety meetings were conducted daily at the beginning of the day and as conditions changed.

The former reserve pit contents were excavated to a depth of approximately 10 ft below the top of the existing material. Excavation of the material was performed using a trackmounted excavator. The material was found to be very dense and heavy. A wellcemented soil (caliche) layer was observed at a depth of approximately 10 to 11 ft below the top of the pit contents. A hard rock shelf was observed protruding into the bottom of the pit near the southern edge of the pit. The rock shelf was encountered at approximately 8 ft below ground surface (bgs).

Reserve pit contents were placed in trucks and transported to the Gandy-Marley Landfarm located near Caprock, New Mexico for disposal. Approximately 2,060 cubic yards of material was removed from the former reserve pit (based on approximately 20 cubic yards of material per truck load).

The stained soil area that was located to the southwest of the former reserve pit was also excavated. A hard caliche layer was also observed within this excavation at a depth of about 10 ft bgs. The area was excavated approximately 23 ft wide, 24 ft long and 16 ft deep. Approximately 340 cubic yards of material was removed and disposed of at the Gandy-Marley Landfarm for a total of approximately 2,400 cubic yards of material removed from both locations. A total of approximately 2,360 cubic yards of clean fill was hauled from the Gandy Marley Landfarm for use as backfill to supplement the berm material.

Drill cuttings from the January 2012 subsurface investigation were removed from the drums that they had been stored in. Soil from the boring that was drilled within the former pit was placed in a truck and disposed of at the Gandy-Marley landfarm. The soil contained in the remaining drums were used as shallow backfill and placed above the liner (see below). The empty drums were disposed of by the subcontractor at a metal recycler.

Berm material was used to backfill the excavation. The imported fill material from the landfarm was assessed to be of better quality for plant growth. This was based on the lack of caliche within the material and the darker color indicating a higher mineral content. Due to this, the berm material was placed in the bottom of the excavation and the imported fill was reserved for the upper portion.

When backfilling reached a depth of approximately 4 ft bgs, a 40-mil polyethylene liner was placed in each excavation. The liner seams were overlapped a minimum of 24 inches. Clean fill was pushed over the liner using a bulldozer to prevent punctures to the liner.

The former reserve pit and stained soil areas were reseeded after completion of backfill activities. The Homestead seed mix was used at a rate of 30 pounds per acre. Seed was broadcasted then wheel-rolled in place in accordance with the seed provider's recommendations. Upon completion of the seed planting process, the reseeded area was watered to promote plant growth. Watering was performed using a water truck (at low pressure to prevent movement of the seed).

Upon completion of seeding, the fence materials were removed from the Site and properly disposed of. Field activities were completed and demobilization occurred on June 8, 2011.

#### Sample Results

Six soil samples from the former reserve pit and one sample from the surface stained area were collected for laboratory analysis. The samples were placed on ice and hand delivered to Hall Environmental Analysis Laboratory. The samples were analyzed for TPH diesel range organics (DRO) and motor oil range organics (MRO) by EPA method 8015B. Results of the soil samples are:

Sample Location	Depth (ft bgs)	(mg/kg)	(mg/kg)
Former Reserve Pit			
20 feet south of northwest			
corner	7	580	970
Center of north wall	7	9,000	3,700
Center of east wall	7	980	620

122078.3-ALB12RP001 Copyright 2012, Kleinfelder

Sample Location	Depth (ft bgs)	(mg/kg)	(mg/kg)
5 feet west of southeast corner	12	19,000	6,400
#2 Grab (base of rock shelf)	10	23,000	9400
Southwest corner	11	16,000	5,700
Surface Stained Area			
Approximate center of			
excavation	16	11,000	3,300

mg/kg= milligrams per kilogram

Sample locations are shown in Figure 3. Laboratory analytical reports are included in Appendix B. Sample results indicate that elevated concentrations of TPH remain in the bottom of both excavations. While the majority of the impacted mass has been removed from both excavations, residual TPH concentrations remain.

# CLOSING

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. It should be recognized that definition and evaluation of geologic and environmental conditions are a difficult and inexact science. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present due to the limitations of data from field studies. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service that provide adequate information for their purposes at acceptable levels of risk. More extensive studies, including subsurface studies or field tests, should be performed to reduce uncertainties. Acceptance of this report will indicate that NMOCD has reviewed the document and determined that it does not need or want a greater level of service than provided.

During the course of the performance of Kleinfelder's services, hazardous materials may have been discovered. Kleinfelder assumes no responsibility or liability whatsoever for any claim, loss of property value, damage, or injury that results from pre-existing hazardous materials being encountered or present on the project site, or from the discovery of such hazardous materials. Nothing contained in this report should be construed or interpreted as requiring Kleinfelder to assume the status of an owner, operator, or generator, or person who arranges for disposal, transport, storage, or treatment of hazardous materials within the meaning of any governmental statute, regulation, or order. NMOCD is solely responsible for directing notification of all governmental agencies, and the public at large, of the existence, release, treatment, or disposal of any hazardous materials observed at the project site, either before or during performance of Kleinfelder's services. NMOCD is responsible for directing all arrangements to lawfully store, treat, recycle, dispose, or otherwise handle hazardous materials, including cuttings and samples resulting from Kleinfelder's services. We appreciate the opportunity to provide these services to NMOCD. Should any questions arise concerning this report; we will be pleased to discuss them with you.

Respectfully submitted,

**KLEINFELDER WEST, INC.**

OrderNo.: 1205B15

Dear Bernard Bockisch:

Hall Environmental Analysis Laboratory received 2 sample(s) on 5/25/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to <u>www.hallenvironmental.com</u> or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

andy

Andy Freeman Laboratory Manager 4901 Hawkins NE Albuquerque, NM 87109

RE: North LEA

OrderNo.: 1203847

Dear Bernard Bockisch:

Hall Environmental Analysis Laboratory received 2 sample(s) on 3/22/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to <u>www.hallenvironmental.com</u> or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

andy

Ms. Anne Thorne Hall Environmental Analysis Laboratory 4901 Hawkins NE Albuquerque, NM 87109

RE: Project: 1203847 Pace Project No.: 3065761

Dear Ms. Thorne:

Enclosed are the analytical results for sample(s) received by the laboratory on March 23, 2012. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carino a. Ferrio

#### Method: EPA 900.0m

Description:900.0 Gross Alpha/BetaClient:Hall Environmental Analysis LaboratoryDate:April 30, 2012

#### **General Information:**

2 samples were analyzed for EPA 900.0m. All samples were received in acceptable condition with any exceptions noted below.

#### Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

#### Method Blank:

All analytes were below the report limit in the method blank with any exceptions noted below.

#### Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

#### Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

#### **Duplicate Sample:**

All duplicate sample results were within method acceptance criteria with any exceptions noted below.

#### Additional Comments:

Sample Comments:

The LCS for Lead-210 associated with this batch failed high. The acceptable limit for the LCS percent recovery is 125% and the obtained recovery for the LCS was 126.44%, all other QC criteria was acceptable. • 1203847-001A NL1-3/20/12 (Lab ID: 3065761001)

#### Analyte Comments:

QC Batch: RADC/11531

N2: The lab does not hold TNI accreditation for this parameter.

#### QUALIFIERS

Project:	1203847		
Pace Project No.:	3065761		

#### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty

(MDC) - Minimum Detectable Concentration

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

#### ANALYTE QUALIFIERS

N2 The lab does not hold TNI accreditation for this parameter.

RE: North Lea J.N.

Hall Environmental Analysis Laboratory 4901 Hawkins NE Albuquerque, NM 87109 TEL: 505-345-3975 FAX: 505-345-4107 Website: www.hallenvironmental.com

OrderNo.: 1206028

Dear Bernard Bockisch:

Hall Environmental Analysis Laboratory received 5 sample(s) on 6/1/2012 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to <u>www.hallenvironmental.com</u> or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

andy

Andy Freeman Laboratory Manager 4901 Hawkins NE Albuquerque, NM 87109

# Appendix C

Site Specific Health and Safety Plan

### I. <u>GENERAL INFORMATION</u>

Site Name: North Lea Joint Venture Pit Remediation

**Site Address:** Near Crossroads, NM. Coordinates: latitude 33.515033, longitude 103.317064 (see Attachment A, "Site Location Map").

### Site Description:

The Site is located approximately 2 miles northwest of Crossroads, New Mexico (see Attachment A, Site Location Map). The Site consists of an abandoned crude oil pit that is surrounded by an earthen berm. It is the intent of the New Mexico Oil Conservation Division (NMOCD) to close out this pit. The property is privately owned by Mrs. Kileen Bresenham.

The reserve pit is approximately 80 feet (ft) by 80 ft in size. The depth is unknown. Hydrocarbon-impacted materials within the reserve pit and an adjacent stained area will be excavated and disposed of at an off-site facility. The contractor performing the work will be EnviroWorks, LLC of Edgewood, New Mexico.

A limited Phase II Environmental Site Assessment (Phase II) was performed at the site in February 2012. The Phase II consisted of advancing three borings at the Subject Site to assess the horizontal and vertical profile of TPH and chloride concentrations. The first boring was drilled within the former reserve pit in an area where the berm was removed. Two additional borings were drilled northeast and southeast of the corners of the former reserve pit.

The results of the Phase II indicated the following:

- Concentrations of TPH appeared to have migrated vertically, but not horizontally since they do not appear to extend laterally beyond the boundaries of the former reserve pit; and
- Concentrations of chlorides appear to have migrated vertically as well as horizontally at depth.

The observed TPH and chloride concentrations are most likely caused by the migration of meteoric waters through the former reserve pit material and into the subsurface. The analytical results from the pit sample did not indicate the presence of volatile organic compounds or the presence of gasoline-range TPH. This may be the result of degradation and volatilization of these compounds due to the age of the former reserve pit.

A volumetric estimate of the berm materials indicates that there are approximately 1100 cubic yards (yd3) of available backfill soil on site. The berm is currently stabilized with native vegetation, a good indication that the material is suitable for use as a top soil.

Soil samples have been collected for analysis of naturally occurring radioactive materials (NORM). Results of these samples do not indicate the presence on NORM associated with the pit materials.

**Scope of Work:** A NMOCD representative (if available), Kleinfelder and the selected contractor employees will mobilize to the site to perform a project kickoff meeting. Prior to performing site work, a Kleinfelder representative will brief the contractor employees on site conditions as part of the project kickoff meeting. Also discussed during the project kickoff meeting will be the HASP, applicable JSA's, and stop work authority (SWA). Tailgate safety meetings will be conducted daily at the beginning of the day and as conditions change. The field program will consist of the following:

- The former reserve pit contents shall be excavated to a depth of approximately 10 ft below the top of the existing material. Removal of this amount of material will allow for some mixing of berm soil into the former reserve pit material to increase stability and workability. This volume has been estimated at approximately 3600 yd3 (including a swell factor of 50%). These materials will be disposed of at the nearby NMOCDapproved Gandy-Marley landfill. Up to 2000 cubic yards of clean backfill soil will be backhauled from the Gandy-Marley landfill. This backhauled clean soil will be used to supplement the on-site berm material for backfill.
- The stained soil area shall also be excavated for disposal. The area to be will be a maximum of 20 ft by 20 ft by 20 ft deep. The maximum amount to be excavated will be approximately 450 yd3, including a swell factor of 50%. Soils shall be field screened during excavation. If field screening samples indicate that soils are below regulatory levels, excavation would halt to minimize the amount of soil to be excavated. Final excavation depths will be confirmed with laboratory analytical data.
- Any on-site drill cuttings that are contained in drums will either be disposed of at the landfill, or used for pit backfill above the liner.
- A 40 mil polyethylene liner shall be placed in the bottom of both excavations. Liner seams shall be overlapped a minimum of 24 inches. The liner to be placed in the former reserve pit shall be a minimum of 90 ft by 90 ft, overlapping the former reserve pit materials by a minimum of 5 ft. Each liner shall be placed without rips or tears. A minimum of 1 foot of clean sand shall be placed over each liner to prevent damage during backfilling.
- Each excavation will be backfilled to grade using the berm material. The backfill material shall be wheel-roll compacted using the on-site equipment.
- After completion of backfill activities, the former reserve pit and stained soil areas will be
  reseeded with a seed mix and rate that is approved by the New Mexico State Land
  Office. Seed can be hand raked into place, but must be mulched. Upon completion of
  the seed planting process, each reseeded area will be watered to promote plant growth.
  The contractor will use a water truck and a hose (at low pressure to prevent movement
  of the seed) to apply the water to the planted areas one time only. Water is not available
  on site and will need to be hauled to the site.
- All fence materials shall be removed from the Site and properly disposed of.

A Kleinfelder representative will be present to observe and document the field activities. The Kleinfelder representative will maintain daily reports of field activities.

### Site Personnel

Contact Name	Company	Phone Number	Project Role
Jim Grippa	Kleinfelder	(858) 320-2000	Division Safety Rep
Bernie Bockisch	Kleinfelder	(505) 401-1955	Project Manager
Maxi Brown	NMOCD	(575) 370-3179	NMOCD Representative
Jim Griswold	NMOCD	(505) 476-3465	NMOCD Project Manager
Elizabeth Bresenhan	Property Owner	(575) 675-2390	Property Owner

### II. JOB LOSS ANALYSIS

The following Job Loss Analysis (JLA) forms shall be used for this project (Attachment C):

- 1. General Site Activities
- 2. Chain of Custody Preparation
- 3. Backfill and Compaction
- 4. Excavation
- 5. Shovel Spreading, Tamping, and Filling
- 6. Soil Sampling (Contaminated)
- 7. Drum Removal and Transport Nonhazardous
- 8. Fieldwork with Biological Hazards
- 9. Heavy Equipment Loading and Unloading
- 10. Moving and Loading Equipment by Hand
- 11. Sample Collection
- 12. Site Preparation
- 13. Site Restoration
- 14. Soil Sampling with Hand Tools
- 15. Utility Clearance Before Drilling

### III. ENVIRONMENTAL MONITORING

The contaminants of concern (COCs) are TPH-DRO/MRO and chlorides. Volatile organics are not anticipated. Field screening using a Petroflag Test Kit will be performed to assess the vertical extent of hydrocarbons in the soil.

### IV. TRAINING REQUIREMENTS

All Kleinfelder site personnel shall be current in Loss Prevention System (LPS) training. Workers entering restricted work areas, where remediation of contaminated soil and/or groundwater occur, are required to be trained in accordance with 29 CFR 1910.120 (40-hour Hazardous Waste Operations and Emergency Response [HAZWOPER]). Workers must have current 8-hour HAZWOPER refresher training. Documents verifying adequate training will be maintained by the Project Manager. Subcontractor supervisors must have current training in first aid and CPR.

### V. SITE-SPECIFIC PHYSICAL HAZARDS

<u>Utilities:</u> New Mexico One Call has been contacted by the subcontractor (ticket number 2012202901). On-site utilities shall be marked prior to earth moving activities. From previous utility locates, a natural gas line is present on site that runs north-south. The natural gas line is located adjacent to the western fence line between the abandoned pit and the stained soil area. Make sure this line is marked prior to earth moving activities.

<u>On-Site Traffic:</u> Site is located in a remote area behind a locked gate. Caution should still be exercised when working near roads. All field representatives should wear safety vests at all times.

<u>Snakes and Insects</u>: The field work will be performed near an abandoned pit. Site vegetation often consists of tall grasses and low-lying brush. All field staff shall stay alert for the presence of snakes and harmful insects and ensure that the area surrounding the engineer or geologist's field truck is located in an area clear of tall vegetation to the extent possible in case snakes and insects are active.

<u>Excavation Hazards</u>: Excavations deeper than 5 feet require shoring or sloping prior to entry. Excavations deeper than 4 feet require ladders or other safe means of entering or exiting. Ladders must be secured and must be spaced not beyond 25 feet apart. Personnel shall not enter the excavation once it reaches a depth of 5 feet. All sloping and benching will be performed in accordance with OSHA 1926.650 Subpart P. A copy of this regulation is attached.

### VI. SITE CONTROL

### Entry and Exit Control Measures:

1. All personnel entering the work area shall wear Personnel Protective Equipment (PPE), as appropriate, to include, but not be limited to, safety glasses, gloves, hearing protection, reflective safety vest, and sturdy safety toe boots.

### Security:

- 1. The Kleinfelder Field Technician shall monitor all visitors entering the work area.
- 2. The Kleinfelder Field Technician shall ensure that all personnel entering the work area shall read and sign the SSHASP signature page.

### **Communications:**

- 1. On-site communications between site personnel shall be verbal and shall not compromise the safety of any individual.
- 2. An operational cellular phone shall be made available to all site personnel by the Kleinfelder Field Technician and shall be used for off-site communication. The Kleinfelder Field Technician shall ensure that all site personnel are alerted to the location of the cellular phone.

### VII. EMERGENCY PROCEDURES

**Communication:** Call 911 immediately for all emergencies using the Kleinfelder-provided cellular phone.

**Emergency Contacts:** See Attachment D, "Emergency Contacts and Map to Hospital" for emergency contact information.

Medical Facility: See Attachment D for directions to the nearest Medical Facility.

**Identification of Potential Emergencies:** See Attachment C for Job Safety Analyses pertaining to site-specific tasks.

**On Site Response:** First aid shall be administered by a competent person until off-site emergency assistance arrives. A first aid kit shall be maintained by the Kleinfelder Field Technician at all times. The Kleinfelder Field Technician shall ensure that all site personnel are alerted to the location of the first aid kit.

**Off-Site Response:** The 911 service shall be used to determine all necessary off-site response (ambulance, fire response, etc.)

### Title 29: Labor

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION Subpart P—Excavations

Browse Previous | Browse Next

### § 1926.651 Specific excavation requirements.

(a) Surface encumbrances. All surface encumbrances that are located so as to create a hazard to employees shall be removed or supported, as necessary, to safeguard employees.

(b) Underground installations. (1) The estimated location of utility installations, such as sewer, telephone, fuel, electric, water lines, or any other underground installations that reasonably may be expected to be encountered during excavation work, shall be determined prior to opening an excavation.

(2) Utility companies or owners shall be contacted within established or customary local response times, advised of the proposed work, and asked to establish the location of the utility underground installations prior to the start of actual excavation. When utility companies or owners cannot respond to a request to locate underground utility installations within 24 hours (unless a longer period is required by state or local law), or cannot establish the exact location of these installations, the employer may proceed, provided the employer does so with caution, and provided detection equipment or other acceptable means to locate utility installations are used.

(3) When excavation operations approach the estimated location of underground installations, the exact location of the installations shall be determined by safe and acceptable means.

(4) While the excavation is open, underground installations shall be protected, supported or removed as necessary to safeguard employees.

(c) Access and egress —(1) Structural ramps. (i) Structural ramps that are used solely by employees as a means of access or egress from excavations shall be designed by a competent person. Structural ramps used for access or egress of equipment shall be designed by a competent person qualified in structural design, and shall be constructed in accordance with the design.

(ii) Ramps and runways constructed of two or more structural members shall have the structural members connected together to prevent displacement.

(iii) Structural members used for ramps and runways shall be of uniform thickness.

(iv) Cleats or other appropriate means used to connect runway structural members shall be attached to the bottom of the runway or shall be attached in a manner to prevent tripping.

(v) Structural ramps used in lieu of steps shall be provided with cleats or other surface treatments on the top surface to prevent slipping.

(2) Means of egress from trench excavations. A stairway, ladder, ramp or other safe means of egress shall be located in trench excavations that are 4 feet (1.22 m) or more in depth so as to require no more than 25 feet (7.62 m) of lateral travel for employees.

(d) *Exposure to vehicular traffic.* Employees exposed to public vehicular traffic shall be provided with, and shall wear, warning vests or other suitable garments marked with or made of reflectorized or high-visibility material.

(e) Exposure to falling loads. No employee shall be permitted underneath loads handled by lifting or digging equipment. Employees shall be required to stand away from any vehicle being loaded or unloaded to avoid being struck by any spillage or falling materials. Operators may remain in the cabs of vehicles being loaded or unloaded when the vehicles are equipped, in accordance with §1926.601(b)(6), to provide adequate protection for the operator during loading and unloading operations.

(f) Warning system for mobile equipment. When mobile equipment is operated adjacent to an excavation, or when such equipment is required to approach the edge of an excavation, and the operator does not have a clear and direct view of the edge of the excavation, a warning system shall be utilized such as barricades, hand or mechanical signals, or stop logs. If possible, the grade should be away from the excavation.

(g) *Hazardous atmospheres* —(1) *Testing and controls*. In addition to the requirements set forth in subparts D and E of this part (29 CFR 1926.50–1926.107) to prevent exposure to harmful levels of atmospheric contaminants and to assure acceptable atmospheric conditions, the following requirements shall apply:

(i) Where oxygen deficiency (atmospheres containing less than 19.5 percent oxygen) or a hazardous atmosphere exists or could reasonably be expected to exist, such as in excavations in landfill areas or excavations in areas where hazardous substances are stored nearby, the atmospheres in the excavation shall be tested before employees enter excavations greater than 4 feet (1.22 m) in depth.

(ii) Adequate precautions shall be taken to prevent employee exposure to atmospheres containing less than 19.5 percent oxygen and other hazardous atmospheres. These precautions include providing proper respiratory protection or ventilation in accordance with subparts D and E of this part respectively.

(iii) Adequate precaution shall be taken such as providing ventilation, to prevent employee exposure to an atmosphere containing a concentration of a flammable gas in excess of 20 percent of the lower flammable limit of the gas.

(iv) When controls are used that are intended to reduce the level of atmospheric contaminants to acceptable levels, testing shall be conducted as often as necessary to ensure that the atmosphere remains safe.

(2) *Emergency rescue equipment.* (i) Emergency rescue equipment, such as breathing apparatus, a safety harness and line, or a basket stretcher, shall be readily available where hazardous atmospheric conditions exist or may reasonably be expected to develop during work in an excavation. This equipment shall be attended when in use.

(ii) Employees entering bell-bottom pier holes, or other similar deep and confined footing excavations, shall wear a harness with a life-line securely attached to it. The lifeline shall be separate from any line used to handle materials, and shall be individually attended at all times while the employee wearing the lifeline is in the excavation.

(h) Protection from hazards associated with water accumulation. (1) Employees shall not work in excavations in which there is accumulated water, or in excavations in which water is accumulating, unless adequate precautions have been taken to protect employees against the hazards posed by water accumulation. The precautions necessary to protect employees adequately vary with each situation, but could include special support or shield systems to protect from cave-ins, water removal to control the level of accumulating water, or use of a safety harness and lifeline.

(2) If water is controlled or prevented from accumulating by the use of water removal equipment, the water removal equipment and operations shall be monitored by a competent person to ensure proper operation.

(3) If excavation work interrupts the natural drainage of surface water (such as streams), diversion ditches, dikes, or other suitable means shall be used to prevent surface water from entering the excavation and to provide adequate drainage of the area adjacent to the excavation. Excavations subject to runoff from heavy rains will require an inspection by a competent person and compliance with paragraphs (h)(1) and (h)(2) of this section.

### Electronic Code of Federal Regulations:

(i) *Stability of adjacent structures.* (1) Where the stability of adjoining buildings, walls, or other structures is endangered by excavation operations, support systems such as shoring, bracing, or underpinning shall be provided to ensure the stability of such structures for the protection of employees.

(2) Excavation below the level of the base or footing of any foundation or retaining wall that could be reasonably expected to pose a hazard to employees shall not be permitted except when:

(i) A support system, such as underpinning, is provided to ensure the safety of employees and the stability of the structure; or

(ii) The excavation is in stable rock; or

(iii) A registered professional engineer has approved the determination that the structure is sufficiently removed from the excavation so as to be unaffected by the excavation activity; or

(iv) A registered professional engineer has approved the determination that such excavation work will not pose a hazard to employees.

(3) Sidewalks, pavements, and appurtenant structure shall not be undermined unless a support system or another method of protection is provided to protect employees from the possible collapse of such structures.

(j) Protection of employees from loose rock or soil. (1) Adequate protection shall be provided to protect employees from loose rock or soil that could pose a hazard by falling or rolling from an excavation face. Such protection shall consist of scaling to remove loose material; installation of protective barricades at intervals as necessary on the face to stop and contain falling material; or other means that provide equivalent protection.

(2) Employees shall be protected from excavated or other materials or equipment that could pose a hazard by falling or rolling into excavations. Protection shall be provided by placing and keeping such materials or equipment at least 2 feet (.61 m) from the edge of excavations, or by the use of retaining devices that are sufficient to prevent materials or equipment from falling or rolling into excavations, or by a combination of both if necessary.

(k) *Inspections*. (1) Daily inspections of excavations, the adjacent areas, and protective systems shall be made by a competent person for evidence of a situation that could result in possible cave-ins, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions. An inspection shall be conducted by the competent person prior to the start of work and as needed throughout the shift. Inspections shall also be made after every rainstorm or other hazard increasing occurrence. These inspections are only required when employee exposure can be reasonably anticipated.

(2) Where the competent person finds evidence of a situation that could result in a possible cave-in, indications of failure of protective systems, hazardous atmospheres, or other hazardous conditions, exposed employees shall be removed from the hazardous area until the necessary precautions have been taken to ensure their safety.

(I) Walkways shall be provided where employees or equipment are required or permitted to cross over excavations. Guardrails which comply with §1926.502(b) shall be provided where walkways are 6 feet (1.8 m) or more above lower levels.

### Title 29: Labor

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION Subpart P—Excavations

Browse Previous

### § 1926.652 Requirements for protective systems.

(a) *Protection of employees in excavations.* (1) Each employee in an excavation shall be protected from cave-ins by an adequate protective system designed in accordance with paragraph (b) or (c) of this section except when:

(i) Excavations are made entirely in stable rock; or

(ii) Excavations are less than 5 feet (1.52m) in depth and examination of the ground by a competent person provides no indication of a potential cave-in.

(2) Protective systems shall have the capacity to resist without failure all loads that are intended or could reasonably be expected to be applied or transmitted to the system.

(b) Design of sloping and benching systems. The slopes and configurations of sloping and benching systems shall be selected and constructed by the employer or his designee and shall be in accordance with the requirements of paragraph (b)(1); or, in the alternative, paragraph (b)(2); or, in the alternative, paragraph (b)(3), or, in the alternative, paragraph (b)(4), as follows:

(1) Option (1)—Allowable configurations and slopes. (i) Excavations shall be sloped at an angle not steeper than one and one-half horizontal to one vertical (34 degrees measured from the horizontal), unless the employer uses one of the other options listed below.

(ii) Slopes specified in paragraph (b)(1)(i) of this section, shall be excavated to form configurations that are in accordance with the slopes shown for Type C soil in appendix B to this subpart.

(2) Option (2)—Determination of slopes and configurations using Appendices A and B. Maximum allowable slopes, and allowable configurations for sloping and benching systems, shall be determined in accordance with the conditions and requirements set forth in appendices A and B to this subpart.

(3) Option (3)—Designs using other tabulated data. (i) Designs of sloping or benching systems shall be selected from and be in accordance with tabulated data, such as tables and charts.

(ii) The tabulated data shall be in written form and shall include all of the following:

(A) Identification of the parameters that affect the selection of a sloping or benching system drawn from such data;

(B) Identification of the limits of use of the data, to include the magnitude and configuration of slopes determined to be safe;

(C) Explanatory information as may be necessary to aid the user in making a correct selection of a

protective system from the data.

(iii) At least one copy of the tabulated data which identifies the registered professional engineer who approved the data, shall be maintained at the jobsite during construction of the protective system. After that time the data may be stored off the jobsite, but a copy of the data shall be made available to the Secretary upon request.

(4) Option (4)—Design by a registered professional engineer. (i) Sloping and benching systems not utilizing Option (1) or Option (2) or Option (3) under paragraph (b) of this section shall be approved by a registered professional engineer.

(ii) Designs shall be in written form and shall include at least the following:

(A) The magnitude of the slopes that were determined to be safe for the particular project;

(B) The configurations that were determined to be safe for the particular project; and

(C) The identity of the registered professional engineer approving the design.

(iii) At least one copy of the design shall be maintained at the jobsite while the slope is being constructed. After that time the design need not be at the jobsite, but a copy shall be made available to the Secretary upon request.

(c) Design of support systems, shield systems, and other protective systems. Designs of support systems shield systems, and other protective systems shall be selected and constructed by the employer or his designee and shall be in accordance with the requirements of paragraph (c)(1); or, in the alternative, paragraph (c)(2); or, in the alternative, paragraph (c)(3); or, in the alternative, paragraph (c) (4) as follows:

(1) Option (1)—Designs using appendices A, C and D. Designs for timber shoring in trenches shall be determined in accordance with the conditions and requirements set forth in appendices A and C to this subpart. Designs for aluminum hydraulic shoring shall be in accordance with paragraph (c)(2) of this section, but if manufacturer's tabulated data cannot be utilized, designs shall be in accordance with appendix D.

(2) Option (2)—Designs Using Manufacturer's Tabulated Data. (i) Design of support systems, shield systems, or other protective systems that are drawn from manufacturer's tabulated data shall be in accordance with all specifications, recommendations, and limitations issued or made by the manufacturer.

(ii) Deviation from the specifications, recommendations, and limitations issued or made by the manufacturer shall only be allowed after the manufacturer issues specific written approval.

(iii) Manufacturer's specifications, recommendations, and limitations, and manufacturer's approval to deviate from the specifications, recommendations, and limitations shall be in written form at the jobsite during construction of the protective system. After that time this data may be stored off the jobsite, but a copy shall be made available to the Secretary upon request.

(3) Option (3)—Designs using other tabulated data. (i) Designs of support systems, shield systems, or other protective systems shall be selected from and be in accordance with tabulated data, such as tables and charts.

(ii) The tabulated data shall be in written form and include all of the following:

(A) Identification of the parameters that affect the selection of a protective system drawn from such data;

(B) Identification of the limits of use of the data;

(C) Explanatory information as may be necessary to aid the user in making a correct selection of a protective system from the data.

(iii) At least one copy of the tabulated data, which identifies the registered professional engineer who

http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&sid=1679e3d4bbf580066346d07d781f... 5/16/2012

### Electronic Code of Federal Regulations:

approved the data, shall be maintained at the jobsite during construction of the protective system. After that time the data may be stored off the jobsite, but a copy of the data shall be made available to the Secretary upon request.

(4) Option (4)—Design by a registered professional engineer. (i) Support systems, shield systems, and other protective systems not utilizing Option 1, Option 2 or Option 3, above, shall be approved by a registered professional engineer.

(ii) Designs shall be in written form and shall include the following:

(A) A plan indicating the sizes, types, and configurations of the materials to be used in the protective system; and

(B) The identity of the registered professional engineer approving the design.

(iii) At least one copy of the design shall be maintained at the jobsite during construction of the protective system. After that time, the design may be stored off the jobsite, but a copy of the design shall be made available to the Secretary upon request.

(d) *Materials and equipment.* (1) Materials and equipment used for protective systems shall be free from damage or defects that might impair their proper function.

(2) Manufactured materials and equipment used for protective systems shall be used and maintained in a manner that is consistent with the recommendations of the manufacturer, and in a manner that will prevent employee exposure to hazards.

(3) When material or equipment that is used for protective systems is damaged, a competent person shall examine the material or equipment and evaluate its suitability for continued use. If the competent person cannot assure the material or equipment is able to support the intended loads or is otherwise suitable for safe use, then such material or equipment shall be removed from service, and shall be evaluated and approved by a registered professional engineer before being returned to service.

(e) *Installation and removal of support* —(1) *General.* (i) Members of support systems shall be securely connected together to prevent sliding, falling, kickouts, or other predictable failure.

(ii) Support systems shall be installed and removed in a manner that protects employees from cave-ins, structural collapses, or from being struck by members of the support system.

(iii) Individual members of support systems shall not be subjected to loads exceeding those which those members were designed to withstand.

(iv) Before temporary removal of individual members begins, additional precautions shall be taken to ensure the safety of employees, such as installing other structural members to carry the loads imposed on the support system.

(v) Removal shall begin at, and progress from, the bottom of the excavation. Members shall be released slowly so as to note any indication of possible failure of the remaining members of the structure or possible cave-in of the sides of the excavation.

(vi) Backfilling shall progress together with the removal of support systems from excavations.

(2) Additional requirements for support systems for trench excavations. (i) Excavation of material to a level no greater than 2 feet (.61 m) below the bottom of the members of a support system shall be permitted, but only if the system is designed to resist the forces calculated for the full depth of the trench, and there are no indications while the trench is open of a possible loss of soil from behind or below the bottom of the support system.

(ii) Installation of a support system shall be closely coordinated with the excavation of trenches.

(f) *Sloping and benching systems*. Employees shall not be permitted to work on the faces of sloped or benched excavations at levels above other employees except when employees at the lower levels are adequately protected from the hazard of falling, rolling, or sliding material or equipment.

(g) *Shield systems* —(1) *General.* (i) Shield systems shall not be subjected to loads exceeding those which the system was designed to withstand.

(ii) Shields shall be installed in a manner to restrict lateral or other hazardous movement of the shield in the event of the application of sudden lateral loads.

(iii) Employees shall be protected from the hazard of cave-ins when entering or exiting the areas protected by shields.

(iv) Employees shall not be allowed in shields when shields are being installed, removed, or moved vertically.

(2) Additional requirement for shield systems used in trench excavations. Excavations of earth material to a level not greater than 2 feet (.61 m) below the bottom of a shield shall be permitted, but only if the shield is designed to resist the forces calculated for the full depth of the trench, and there are no indications while the trench is open of a possible loss of soil from behind or below the bottom of the shield.

### Title 29: Labor

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION Subpart P—Excavations

Browse Next

### § 1926.650 Scope, application, and definitions applicable to this subpart.

(a) *Scope and application.* This subpart applies to all open excavations made in the earth's surface. Excavations are defined to include trenches.

(b) Definitions applicable to this subpart.

Accepted engineering practices means those requirements which are compatible with standards of practice required by a registered professional engineer.

*Aluminum Hydraulic Shoring* means a pre-engineered shoring system comprised of aluminum hydraulic cylinders (crossbraces) used in conjunction with vertical rails (uprights) or horizontal rails (walers). Such system is designed, specifically to support the sidewalls of an excavation and prevent cave-ins.

*Bell-bottom pier hole* means a type of shaft or footing excavation, the bottom of which is made larger than the cross section above to form a belled shape.

*Benching* (Benching system) means a method of protecting employees from cave-ins by excavating the sides of an excavation to form one or a series of horizontal levels or steps, usually with vertical or near-vertical surfaces between levels.

*Cave-in* means the separation of a mass of soil or rock material from the side of an excavation, or the loss of soil from under a trench shield or support system, and its sudden movement into the excavation, either by falling or sliding, in sufficient quantity so that it could entrap, bury, or otherwise injure and immobilize a person.

*Competent person* means one who is capable of identifying existing and predictable hazards in the surroundings, or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

*Cross braces* mean the horizontal members of a shoring system installed perpendicular to the sides of the excavation, the ends of which bear against either uprights or wales.

*Excavation* means any man-made cut, cavity, trench, or depression in an earth surface, formed by earth removal.

Faces or sides means the vertical or inclined earth surfaces formed as a result of excavation work.

*Failure* means the breakage, displacement, or permanent deformation of a structural member or connection so as to reduce its structural integrity and its supportive capabilities.

Hazardous atmosphere means an atmosphere which by reason of being explosive, flammable,

poisonous, corrosive, oxidizing, irritating, oxygen deficient, toxic, or otherwise harmful, may cause death, illness, or injury.

Kickout means the accidental release or failure of a cross brace.

*Protective system* means a method of protecting employees from cave-ins, from material that could fall or roll from an excavation face or into an excavation, or from the collapse of adjacent structures. Protective systems include support systems, sloping and benching systems, shield systems, and other systems that provide the necessary protection.

*Ramp* means an inclined walking or working surface that is used to gain access to one point from another, and is constructed from earth or from structural materials such as steel or wood.

Registered Professional Engineer means a person who is registered as a professional engineer in the state where the work is to be performed. However, a professional engineer, registered in any state is deemed to be a "registered professional engineer" within the meaning of this standard when approving designs for "manufactured protective systems" or "tabulated data" to be used in interstate commerce.

Sheeting means the members of a shoring system that retain the earth in position and in turn are supported by other members of the shoring system.

Shield (Shield system) means a structure that is able to withstand the forces imposed on it by a cave-in and thereby protect employees within the structure. Shields can be permanent structures or can be designed to be portable and moved along as work progresses. Additionally, shields can be either premanufactured or job-built in accordance with §1926.652 (c)(3) or (c)(4). Shields used in trenches are usually referred to as "trench boxes" or "trench shields."

*Shoring* (Shoring system) means a structure such as a metal hydraulic, mechanical or timber shoring system that supports the sides of an excavation and which is designed to prevent cave-ins.

Sides. See "Faces."

*Sloping* (Sloping system) means a method of protecting employees from cave-ins by excavating to form sides of an excavation that are inclined away from the excavation so as to prevent cave-ins. The angle of incline required to prevent a cave-in varies with differences in such factors as the soil type, environmental conditions of exposure, and application of surcharge loads.

Stable rock means natural solid mineral material that can be excavated with vertical sides and will remain intact while exposed. Unstable rock is considered to be stable when the rock material on the side or sides of the excavation is secured against caving-in or movement by rock bolts or by another protective system that has been designed by a registered professional engineer.

*Structural ramp* means a ramp built of steel or wood, usually used for vehicle access. Ramps made of soil or rock are not considered structural ramps.

*Support system* means a structure such as underpinning, bracing, or shoring, which provides support to an adjacent structure, underground installation, or the sides of an excavation.

*Tabulated data* means tables and charts approved by a registered professional engineer and used to design and construct a protective system.

*Trench* (Trench excavation) means a narrow excavation (in relation to its length) made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench (measured at the bottom) is not greater than 15 feet (4.6 m). If forms or other structures are installed or constructed in an excavation so as to reduce the dimension measured from the forms or structure to the side of the excavation to 15 feet (4.6 m) or less (measured at the bottom of the excavation), the excavation is also considered to be a trench.

Trench box. See "Shield."

Trench shield. See "Shield."

Uprights means the vertical members of a trench shoring system placed in contact with the earth and

http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&sid=1679e3d4bbf580066346d07d781f... 5/16/2012

usually positioned so that individual members do not contact each other. Uprights placed so that individual members are closely spaced, in contact with or interconnected to each other, are often called "sheeting."

Wales means horizontal members of a shoring system placed parallel to the excavation face whose sides bear against the vertical members of the shoring system or earth.

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION Subpart P—Excavations

**Browse Next** 

### Appendix A to Subpart P of Part 1926—Soil Classification

(a) Scope and application —(1) Scope. This appendix describes a method of classifying soil and rock deposits based on site and environmental conditions, and on the structure and composition of the earth deposits. The appendix contains definitions, sets forth requirements, and describes acceptable visual and manual tests for use in classifying soils.

(2) *Application.* This appendix applies when a sloping or benching system is designed in accordance with the requirements set forth in §1926.652(b)(2) as a method of protection for employees from caveins. This appendix also applies when timber shoring for excavations is designed as a method of protection from cave-ins in accordance with appendix C to subpart P of part 1926, and when aluminum hydraulic shoring is designed in accordance with appendix D. This appendix also applies if other protective systems are designed and selected for use from data prepared in accordance with the requirements set forth in §1926.652(c), and the use of the data is predicated on the use of the soil classification system set forth in this appendix.

(b) *Definitions.* The definitions and examples given below are based on, in whole or in part, the following: American Society for Testing Materials (ASTM) Standards D653–85 and D2488; The Unified Soils Classification System, The U.S. Department of Agriculture (USDA) Textural Classification Scheme; and The National Bureau of Standards Report BSS–121.

*Cemented soil* means a soil in which the particles are held together by a chemical agent, such as calcium carbonate, such that a hand-size sample cannot be crushed into powder or individual soil particles by finger pressure.

*Cohesive soil* means clay (fine grained soil), or soil with a high clay content, which has cohesive strength. Cohesive soil does not crumble, can be excavated with vertical sideslopes, and is plastic when moist. Cohesive soil is hard to break up when dry, and exhibits significant cohesion when submerged. Cohesive soils include clayey silt, sandy clay, silty clay, clay and organic clay.

Dry soil means soil that does not exhibit visible signs of moisture content.

*Fissured* means a soil material that has a tendency to break along definite planes of fracture with little resistance, or a material that exhibits open cracks, such as tension cracks, in an exposed surface.

*Granular soil* means gravel, sand, or silt, (coarse grained soil) with little or no clay content. Granular soil has no cohesive strength. Some moist granular soils exhibit apparent cohesion. Granular soil cannot be molded when moist and crumbles easily when dry.

Layered system means two or more distinctly different soil or rock types arranged in layers. Micaceous seams or weakened planes in rock or shale are considered layered.

Moist soil means a condition in which a soil looks and feels damp. Moist cohesive soil can easily be

shaped into a ball and rolled into small diameter threads before crumbling. Moist granular soil that contains some cohesive material will exhibit signs of cohesion between particles.

*Plastic* means a property of a soil which allows the soil to be deformed or molded without cracking, or appreciable volume change.

Saturated soil means a soil in which the voids are filled with water. Saturation does not require flow. Saturation, or near saturation, is necessary for the proper use of instruments such as a pocket penetrometer or sheer vane.

Soil classification system means, for the purpose of this subpart, a method of categorizing soil and rock deposits in a hierarchy of Stable Rock, Type A, Type B, and Type C, in decreasing order of stability. The categories are determined based on an analysis of the properties and performance characteristics of the deposits and the environmental conditions of exposure.

Stable rock means natural solid mineral matter that can be excavated with vertical sides and remain intact while exposed.

Submerged soil means soil which is underwater or is free seeping.

*Type A* means cohesive soils with an unconfined compressive strength of 1.5 ton per square foot (tsf) (144 kPa) or greater. Examples of cohesive soils are: clay, silty clay, sandy clay, clay loam and, in some cases, silty clay loam and sandy clay loam. Cemented soils such as caliche and hardpan are also considered Type A. However, no soil is Type A if:

(i) The soil is fissured; or

(ii) The soil is subject to vibration from heavy traffic, pile driving, or similar effects; or

(iii) The soil has been previously disturbed; or

(iv) The soil is part of a sloped, layered system where the layers dip into the excavation on a slope of four horizontal to one vertical (4H:1V) or greater; or

(v) The material is subject to other factors that would require it to be classified as a less stable material.

*Type B* means:

(i) Cohesive soil with an unconfined compressive strength greater than 0.5 tsf (48 kPa) but less than 1.5 tsf (144 kPa); or

(ii) Granular cohesionless soils including: angular gravel (similar to crushed rock), silt, silt loam, sandy loam and, in some cases, silty clay loam and sandy clay loam.

(iii) Previously disturbed soils except those which would otherwise be classed as Type C soil.

(iv) Soil that meets the unconfined compressive strength or cementation requirements for Type A, but is fissured or subject to vibration; or

(v) Dry rock that is not stable; or

(vi) Material that is part of a sloped, layered system where the layers dip into the excavation on a slope less steep than four horizontal to one vertical (4H:1V), but only if the material would otherwise be classified as Type B.

Type C means:

(i) Cohesive soil with an unconfined compressive strength of 0.5 tsf (48 kPa) or less; or

(ii) Granular soils including gravel, sand, and loamy sand; or

http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&sid=1679e3d4bbf580066346d07d781f... 5/16/2012

(iii) Submerged soil or soil from which water is freely seeping; or

(iv) Submerged rock that is not stable, or

(v) Material in a sloped, layered system where the layers dip into the excavation or a slope of four horizontal to one vertical (4H:1V) or steeper.

*Unconfined compressive strength* means the load per unit area at which a soil will fail in compression. It can be determined by laboratory testing, or estimated in the field using a pocket penetrometer, by thumb penetration tests, and other methods.

Wet soil means soil that contains significantly more moisture than moist soil, but in such a range of values that cohesive material will slump or begin to flow when vibrated. Granular material that would exhibit cohesive properties when moist will lose those cohesive properties when wet.

(c) *Requirements* —(1) *Classification of soil and rock deposits*. Each soil and rock deposit shall be classified by a competent person as Stable Rock, Type A, Type B, or Type C in accordance with the definitions set forth in paragraph (b) of this appendix.

(2) Basis of classification. The classification of the deposits shall be made based on the results of at least one visual and at least one manual analysis. Such analyses shall be conducted by a competent person using tests described in paragraph (d) below, or in other recognized methods of soil classification and testing such as those adopted by the America Society for Testing Materials, or the U.S. Department of Agriculture textural classification system.

(3) Visual and manual analyses. The visual and manual analyses, such as those noted as being acceptable in paragraph (d) of this appendix, shall be designed and conducted to provide sufficient quantitative and qualitative information as may be necessary to identify properly the properties, factors, and conditions affecting the classification of the deposits.

(4) *Layered systems.* In a layered system, the system shall be classified in accordance with its weakest layer. However, each layer may be classified individually where a more stable layer lies under a less stable layer.

(5) *Reclassification.* If, after classifying a deposit, the properties, factors, or conditions affecting its classification change in any way, the changes shall be evaluated by a competent person. The deposit shall be reclassified as necessary to reflect the changed circumstances.

(d) Acceptable visual and manual tests —(1) Visual tests. Visual analysis is conducted to determine qualitative information regarding the excavation site in general, the soil adjacent to the excavation, the soil forming the sides of the open excavation, and the soil taken as samples from excavated material.

(i) Observe samples of soil that are excavated and soil in the sides of the excavation. Estimate the range of particle sizes and the relative amounts of the particle sizes. Soil that is primarily composed of finegrained material is cohesive material. Soil composed primarily of coarse-grained sand or gravel is granular material.

(ii) Observe soil as it is excavated. Soil that remains in clumps when excavated is cohesive. Soil that breaks up easily and does not stay in clumps is granular.

(iii) Observe the side of the opened excavation and the surface area adjacent to the excavation. Cracklike openings such as tension cracks could indicate fissured material. If chunks of soil spall off a vertical side, the soil could be fissured. Small spalls are evidence of moving ground and are indications of potentially hazardous situations.

(iv) Observe the area adjacent to the excavation and the excavation itself for evidence of existing utility and other underground structures, and to identify previously disturbed soil.

(v) Observe the opened side of the excavation to identify layered systems. Examine layered systems to identify if the layers slope toward the excavation. Estimate the degree of slope of the layers.

(vi) Observe the area adjacent to the excavation and the sides of the opened excavation for evidence of surface water, water seeping from the sides of the excavation, or the location of the level of the water

### table.

(vii) Observe the area adjacent to the excavation and the area within the excavation for sources of vibration that may affect the stability of the excavation face.

(2) *Manual tests.* Manual analysis of soil samples is conducted to determine quantitative as well as qualitative properties of soil and to provide more information in order to classify soil properly.

(i) *Plasticity.* Mold a moist or wet sample of soil into a ball and attempt to roll it into threads as thin as1/8-inch in diameter. Cohesive material can be successfully rolled into threads without crumbling. For example, if at least a two inch (50 mm) length of1/8-inch thread can be held on one end without tearing, the soil is cohesive.

(ii) *Dry strength.* If the soil is dry and crumbles on its own or with moderate pressure into individual grains or fine powder, it is granular (any combination of gravel, sand, or silt). If the soil is dry and falls into clumps which break up into smaller clumps, but the smaller clumps can only be broken up with difficulty, it may be clay in any combination with gravel, sand or silt. If the dry soil breaks into clumps which do not break up into small clumps and which can only be broken with difficulty, and there is no visual indication the soil is fissured, the soil may be considered unfissured.

(iii) *Thumb penetration.* The thumb penetration test can be used to estimate the unconfined compressive strength of cohesive soils. (This test is based on the thumb penetration test described in American Society for Testing and Materials (ASTM) Standard designation D2488—"Standard Recommended Practice for Description of Soils (Visual—Manual Procedure).") Type A soils with an unconfined compressive strength of 1.5 tsf can be readily indented by the thumb; however, they can be penetrated by the thumb only with very great effort. Type C soils with an unconfined compressive strength of 0.5 tsf can be easily penetrated several inches by the thumb, and can be molded by light finger pressure. This test should be conducted on an undisturbed soil sample, such as a large clump of spoil, as soon as practicable after excavation to keep to a miminum the effects of exposure to drying influences. If the excavation is later exposed to wetting influences (rain, flooding), the classification of the soil must be changed accordingly.

(iv) Other strength tests. Estimates of unconfined compressive strength of soils can also be obtained by use of a pocket penetrometer or by using a hand-operated shearvane.

(v) *Drying test.* The basic purpose of the drying test is to differentiate between cohesive material with fissures, unfissured cohesive material, and granular material. The procedure for the drying test involves drying a sample of soil that is approximately one inch thick (2.54 cm) and six inches (15.24 cm) in diameter until it is thoroughly dry:

(A) If the sample develops cracks as it dries, significant fissures are indicated.

(B) Samples that dry without cracking are to be broken by hand. If considerable force is necessary to break a sample, the soil has significant cohesive material content. The soil can be classified as a unfissured cohesive material and the unconfined compressive strength should be determined.

(C) If a sample breaks easily by hand, it is either a fissured cohesive material or a granular material. To distinguish between the two, pulverize the dried clumps of the sample by hand or by stepping on them. If the clumps do not pulverize easily, the material is cohesive with fissures. If they pulverize easily into very small fragments, the material is granular.

Title 29: Labor

PART 1926—SAFETY AND HEALTH REGULATIONS FOR CONSTRUCTION Subpart P—Excavations

Browse Previous | Browse Next

### Appendix B to Subpart P of Part 1926—Sloping and Benching

(a) *Scope and application.* This appendix contains specifications for sloping and benching when used as methods of protecting employees working in excavations from cave-ins. The requirements of this appendix apply when the design of sloping and benching protective systems is to be performed in accordance with the requirements set forth in §1926.652(b)(2).

(b) Definitions.

Actual slope means the slope to which an excavation face is excavated.

*Distress* means that the soil is in a condition where a cave-in is imminent or is likely to occur. Distress is evidenced by such phenomena as the development of fissures in the face of or adjacent to an open excavation; the subsidence of the edge of an excavation; the slumping of material from the face or the bulging or heaving of material from the bottom of an excavation; the spalling of material from the face of an excavation; the spalling of material from the face of an excavation; and ravelling, i.e., small amounts of material such as pebbles or little clumps of material suddenly separating from the face of an excavation and trickling or rolling down into the excavation.

*Maximum allowable slope* means the steepest incline of an excavation face that is acceptable for the most favorable site conditions as protection against cave-ins, and is expressed as the ratio of horizontal distance to vertical rise (H:V).

Short term exposure means a period of time less than or equal to 24 hours that an excavation is open.

(c) *Requirements* —(1) *Soil classification*. Soil and rock deposits shall be classified in accordance with appendix A to subpart P of part 1926.

(2) *Maximum allowable slope*. The maximum allowable slope for a soil or rock deposit shall be determined from Table B–1 of this appendix.

(3) Actual slope. (i) The actual slope shall not be steeper than the maximum allowable slope.

(ii) The actual slope shall be less steep than the maximum allowable slope, when there are signs of distress. If that situation occurs, the slope shall be cut back to an actual slope which is at least1/2horizontal to one vertical (1/2H:1V) less steep than the maximum allowable slope.

(iii) When surcharge loads from stored material or equipment, operating equipment, or traffic are present, a competent person shall determine the degree to which the actual slope must be reduced below the maximum allowable slope, and shall assure that such reduction is achieved. Surcharge loads from adjacent structures shall be evaluated in accordance with §1926.651(i).

(4) Configurations. Configurations of sloping and benching systems shall be in accordance with Figure

B–1.

TABLE 8-1 NAXIMUM ALLONABLE SLOPES

SOL OF ROCK TYPE	HATENUM ALLOWABLE SLOPES (HEV) <sup>(1)</sup> FOR ELCAVATIONS LESS THAN 20 FEET DEEP 151
STABLE ROCK TYPE A (?) TYPE B TYPE C	7 ER TIC AL (907) 3/4 : 1 (537) 1:1 (467) 1%: 1 (347)

BOTES:

- Fumbers shown in paramtheses next to maximum alloyable slopes are angles expressed in degrees from the horizontal. Angles have been rounded off.
- A short-tyrn maximum allowable slope of 1/28:1V (63\*) is allowed in annovations in Type A soil that are if free (3.67 m) or less in dapth. Short-cern exigume allowable slopes for uncavations greater than 12 feet (3.67 m) in depth shall be 3/48:1V (33\*).
- Steping or benching for excavations greater than 20 feet deep shall be designed by a registered professional engineer.

	Soil concentrations sufficient to sustain combustion of vapors ignited by sparks created when equipment comes in contact with rocks or other buried objects. (Cont.)	Conduct periodic/continuous air monitoring of work zone using an LEL/O2 meter. Ensure vapor concentrations <10% LEL and below action level. See HASP for specific direction on action levels. Ensure a fire extinguisher is present on-site and easily accessible.				
Remove soil using heavy equipment. (Co	Underground utilities may be ruptured during soil removal in excavation/trenching activities; potential fire, explosion or electrocution	Underground utilities, piping, and o prior to excavation activities. (Ensu and cleared; conduct private utility practicable) ;Review latest recorde utility inspection.	other services must be marked out ure One-Call/Dig Safe service notified locating for site services as ed drawings for the site and conduct			
	Operating heavy equipment over unstable ground.	Where unstable soil exists, the soi professional engineer to ensure sa control measures.	I should be assessed by a qualified fe site conditions. Implement design			
	Pedestrian/unauthorized visitor injury.	Prevent unauthorized access; del physical barriers (caution tape, fen inadvertent entry; ensure proper s	ineate work area properlyUtilize icing, barricades) to prevent signage visible to indicate work area.			
	On-site workers may be injured/killed by       Stay         the heavy equipment being used to move soil.       from		nsure that your approach is made ne operator.			
Stockpile soil or place soil in 55-gallon drums	Inhalation of particulates.	Apply dust control measures. If du fitted respirator with HEPA filters, of appropriate dust mask must be do on action levels.	ust control is insufficient, a properly or, depending on dust levels, an nned. See HASP for specific direction			
	Hand abrasions, crushed toes while moving drums.	Wear leather gloves when handlin are worn.	g drums, and ensure steel-toe boots			
	Back Strain/Injury	Utilize proper back safety techniqu or other mechanical means to mov	es; Use powered lift truck, drum cart, ve drums.			
	Material falling into excavation	Stockpile material more than 2' fro	m edge of excavation.			
Covering soil stock pile.	There is the potential that stockpiled soil could experience erosion where rainfall could possibly wash the soil from it's location.	To prevent erosion or prevent mig underlayment of medium or high d 30 mils. All stockpiles should be of sheeting at all times when stockpil that the contaminated materials si sensitive receptors like dry wells, of Stockpile should be barricaded to	ration of contaminants, use a ensity polyethylene with a thickness of covered with 10 mil polyethylene e is not being actively worked. Ensure tockpile is not located near any etc. Refer for HASP. secure the soil covering.			
	Contamination/exposure to hazardous materials	Wear appropriate PPE as specified Do not walk on/climb up stockpiles	d in HASP Work from ground-surface only.

						Review contractor JLA prior to star	ting task.
						Workers are to wear PPE as directed by the corresponding HASP and JLA.	
						Remain outside the exclusion zone while equipment is being operated.	
			Injury due to contact with heavy equipment operation			If it is necessary to enter exclusion zone, establish eye contact with operator and verify that the operator's hands are off the controls. "Show Me Your Hands".	
						Identify swing radius and tip over distance of any equipment booms/arms and maintain at least that distance away, if possible.	
0						Stay out of the "Line of Fire" by asking the subcontractor where the best place to stand is to avoid potential hazards associated with hydraulic lines, shoring, load failure, etc.	
0	serve backing and compaction					Do not walk under raised loads.	
			Slips, trips, and falls due to uneven ground surfaces.			Conduct LPSAs on foot placement prevention of slips, trips, and falls. remember to ACT and mitigate the	and housekeeping to aid in the If a potential hazard is identified, potential hazard.
			Property damage from equipment contacting aboveground structures.			Verify that contractor has an assigned spotter for each piece of equipment moving onsite.	
						Continually assess site for limited or hazardous clearances between personnel, equipment, and structures.	
		Hearing damage due to noise from equipment		Wear hearing protection if normal conversation between two people cannot be maintained at a distance of three (3) feet.			

Job Task	Observation of Backfill and Compaction						
Publish Date:	January 29, 2010	Origination Date:	February 21, 2006				
Observe backfill and compaction (cont.)	Failed compaction tests	Verify (through measurement of lifts and tests) that established compaction testing guidelines and permits for project are being followed (if applicable).					
	Dust spreading outside work area	Verify that dust is being controlled t etc.) and in compliance with permit	hrough mitigating measures (water, s.				
Document Task Activity	Unable to prove through records that task performed as required	Complete task documentation legit	ly and in a timely manner				
Personnel trained/certified/qualified to perform task	Work is invalid as performed by person not trained/certified/qualified to perform task	Verify that correct training and certi performing tasks.	fication is provided for individuals				
Perform task according to approved	Perform wrong test/job function	Review work plan or other directing	document before performing task.				
plan/procedure	Miss a step or make a mistake while performing activity	Have copy of procedure/standard available while performing task
