Jim

Attached is the SDS & additional information pertaining to the Aspen Grow product that we are utilizing in our remediation practices. Over the last couple of years, this has been our primary practice for remediation, and we have seen very good results. Some of the benefits of utilizing an in-situ bio-remediation are: less intrusive, lower risks, retention of native soils, and economics. In a previous email I attached a list of remediations that we have completed. The initial & final analytical shows surface (0-4') remediation, while showing little to no elevation of impact at deeper levels. The utilization of this process aids us by removing the unknown subsurface risks, as well as allowing us to retain the native soil (and the natural vegetation) for the area. The reduction of remediation costs has also allowed us the ability to be more proactive in preventative maintenance and equipment fail safes. The process does take longer than the standard method of removal, however BOCI feels that it is a safer alternative.

We would welcome the opportunity to show you the process, and to discuss the product with Aspen Grow LLC. I added Robert & Victoria with the NMOCD, to give them a brief explanation of the product/process as well as give them an opportunity to view our remediation practice as well as ask any questions that they may have. Once you have had a chance to look at our previous remediations & analytical, let me know if you have any additional questions or if/when you'd like to discuss the bio-remediation process that we have been utilizing. If there is any additional analytical that you need from me, don't hesitate to ask. Thank you.
