 - b. Analysis (page 8)
 - c. Results (page 13)
 - d. Summary (page 11)
7. Results Comparison attached (page 14)
8. The raw test data will be kept on file for a period of 3-year and will be made available to the NMOCD upon written request. (page 13)
9. Conclusions (page 15)
10. Any pressure or temperature anomaly: As seen in Figure 2 there is a slight fluctuation in the surface pressure due to temperature. The difference between the max and min pressure is 26.2 psi. Since the fluctuation is small and occurs consistently it did not affect the test.
11. Plots attached
 - a. Calculated BH Pressure vs Time (page 13)
 - b. Injection Volumes and Surface Pressure (page 15)
12. NO PVT data necessary, wellbore fluid is fresh-to-slightly saline water. No significant hydrocarbons present that would alter the density, compressibility and/or viscosity of the fluid.
 - a. See attached partial report of the Second Quarter WQ Report (page 17-21)
13. The Agua Moss, LLC internal Daily Injection Reports were used to determine the appropriate injection history to use for the analysis. A summary of those reports (January 2019 through September 2019) are attached. (page 22-24)
14. The Sunco Disposal #1 has injected approximately 16,389,931 bbls into the point lookout formation from 1994 through August 2019. The offset well McGrath SWD #4 API 30-045-25923 was plugged 7/25/2013. Cumulative injection 1994-7/2013 27,746,479 bbls.
15. 2 Mile AOR:
 - a. AOR 2 mile (page 25)
 - b. AOR 2 mile well data (page 26)
 - c. The McGrath #4 was the only offset well that was injecting into the Point Lookout formation within 1 mile. This well was plugged 7/25/2013.
16. Geological information was provided in the 2012 Permit renewal and approved in 2012.

17. Offset Wells: One offset well that was completed in the same injection interval was the McGrath #4. This well was plugged 7/2013 and therefore was not impacted.
18. Chronological listing of the daily, testing activities (Operations Log) attached (page 31)
 - a. Date of Test: **September 1st, 2020 through September 8th, 2020**
 - b. Type of injection fluid: **Produced water**
 - c. Total shut-in time: **168 hours**
 - d. Final BH static pressure at the end of the RPE: **2967.5 psi**
19. Location of the shut-in valve: **A wing valve located on the well's Christmas Tree was closed to begin the RPE Test.**
20. Pressure Gauges: (see attached)
 - a. HOBO UX120-006M data logger with a TE connectivity M5200 industrial pressure transducer (page 34)
 - b. Pressure range: **0-3000 psig** (page 35)
 - c. Last Calibration: **8/21/2020** (page 45)

Conditions of Approval (if any):

SUBJECT: REQUEST TO MODIFY THE SUNCO #1 2020 ANNUAL FALL OFF TEST

Dear Carl Chavez:

Agua Moss, LLC requests the OCD's approval to forego the Sunco #1's annual fall off test for the 2020 reporting period and instead complete a reservoir pressure evaluation test (RPE).

After evaluating the 2020 injection volumes and economic viability for the Sunco #1, Agua Moss, LLC feels that performing a fall of test this year would only affirm existing data. Over the past few years, the fall off test results have yielded similar results and have not indicated reasons for concern. Please see the table below.

¹ Pressure collected from Reservoir Pressure Evaluation test, all other data from Fall Off Test

This year, our total injected volume has been minimal. From January to July of 2020, we've injected ~5600 total bbls of fluid. The fall off test alone requires ~6500 bbls to perform, so we would have to outsource a significant volume of fluid. Additionally, the well has not indicated any abnormal mechanical issues or pressures. The highest injection pressure recorded this year was 2175 psig, which is significantly below the facility's max allowable pressure of 2400 psig. Based on this year's injection volumes and current operating conditions, we presume that there is no additional stress to the injection zone that would warrant concern or require fall off test analytics. We are also requesting to forgo the slickline work. Operating surface pressures have not indicated restrictions downhole. If an indication does occur it will be addressed at that time.

Economics are another reason for not performing the fall off test. When evaluating the viability of continuing operations, the cost to perform and analyze the fall off test plays a significant role in the economics. This cost especially impacts the economics when volumes are marginal. Agua Moss understands the importance of this well to the State, so the avoidance of any additional expenditure aids in the continuance of our operations.

In addition, the RPE test that we are requesting requires fewer people on location. During COVID-19 restrictions it is best to limit contact for everyone even though this is essential work.

Please let us know your decision as soon as possible. If we aren't able to perform the RPE, we would need to plan accordingly to make the September report submission deadline.

Thank you,

Shacie Murray

Version 1: Static Reservoir Pressure Evaluation Procedure subject to change based on changing well conditions.

Proposed Test Schedule:

Date	Event	Remarks
Monday, September 1 st , 2020	Check conditions, check pressures and perform MIT	MIT, check tubing pressure 9 am
Friday, September 5 th , 2020	96 hrs	Conclude test at 9am

Test Considerations:

- V.1 The pressure acquisition will be performed with pressure gauges at the surface.
- V.2 There will be adequate storage capacity for waste water for the duration of the test.
- V.3 There is one offset well completed in the Point Lookout disposal formation. The McGrath #4 is a class II disposal operated by ConocoPhillips approx 1.25 miles to the north west of the Sunco #1. The well has been P&A'd, so there will not be any injection activity from offset wells during the test.
- V.4 A shut-in valve is located on the injection riser approx 3-feet from the wellhead. This valve can be shut to isolated the tubing at the wellhead.
- V.5 Bottomhole pressure will not be collected directly but calculated from the surface pressure collected using the appropriate gradient. The use of surface pressure for the test is justified by the fact that the well will maintain a positive pressure at the surface during the entire test (injection and pressure falloff).
- V.6 A test log will be kept during the test and submitted with the FOT results. The log will include key events with date and times.
- Well isolation
 - Pressure recordings
- V.7 Surface pressures will be recorded continuously using a data logger and transducer during the FOT. If any abnormal surface pressure change occurs the test validity will be questioned and the test will be aborted if deemed invalid.

V.8 The continuous data recording consists of a HOBO UX120-006M data logger with a TE connectivity M5200 industrial pressure transducer. The data logger features 4MB memory capable of keeping 1.9 million measurements, 1 year batter life (at 1 minute logging and 15 second sampling interval), and an accuracy of +/- 0.3%. Data will be recorded every 15 seconds. The pressure transducer has an accuracy of +/-0.25% and operating pressure range of 0-3,000 psi.

V.9 In addition, a chart recorder will monitor the tubing and casing pressure during the test as a backup for the data logger

Reservoir Pressure Test Procedure:

Prepare Well for Fall Off Test

1. Perform MIT
2. Setup pressure recording chart and digital gauge

Conduct Pressure Monitoring

1. Ensure surface gauges are configured properly
2. Record surface tubing pressure data for 96 hrs, Pressure reading will be taken every minute.
 - a. Bottomhole pressures will be calculated and compiled for the test for review
3. Put well back into service for normal operation.

A Reservoir Pressure Evaluation Test (RPE) was performed on the Sunco SWD #1 Class I injection well (UICI-5-0) on **09/01/2020**. The RPE was approved by Carl Chaves on 8/25/2020 to fulfill the permit required annual Falloff Test. Below is a summary of the findings from the RPE Test.

Procedure:

Two TE connectivity M5200 industrial pressure transducers were installed in parallel with a two-pin pressure recording chart meter. Injection pumps were shut down and the well was isolated at the wellhead. Pressures were recorded for 168 hours. Bottom hole pressure (BHP) was calculated based on the June 5, 2020, specific gravity measurement and the 2019 wireline fill depth of 4362' with reference to ground level. The initial calculated BHP was 2953 psi at a depth of 4362'. The pressure from the transducers was recorded every 10 seconds and the pressure was charted continually over 7 days. The final calculated bottom hole pressure was 2967.5 psi on 09/08/2020 at 10:45 am.

Analysis:

The surface pressure data was compiled in excel and analyzed. The BHP was calculated using a 0.436 psi/ft. The slight pressure fluctuations that repeat daily appear to be an effect of temperature change.

Figure 2 Calculated BH Pressure vs. Time

Results:

The well maintained a positive pressure during the entire RPE Test allowing a BHP to be calculated from the surface pressure readings collected. The average calculated BHP was 2,968 psi. The steady reservoir pressure observed during the RPE indicates that the reservoir was in a near static state. This is due to the small amount of injection that has occurred this year and an ample shut-in period prior to the RPE Test. The RPE test this year was conducted with fill over a portion of the perforations

Comparison with past Falloff Tests:

The results from the 2020 RPE were compiled with previous RPE and FOT results from the facility and are shown below in Table 1.

Agua Moss did not conduct tests prior to 2015 and is relying on the 2010 report submitted by Key Energy, the past operator, for those results. The following observations were derived from a comparison of the results:

1. The surface pressures collected were relatively consistent indicating that the reservoir has equalized and the calculated BHP is representative of static reservoir pressure.
2. The calculated BHP was within an expected range and was below the extrapolated reservoir pressures from previous FOTs.

The raw test data obtained during the 2020 RPE test will be kept on file for a period of three (3) years and will be available upon request.

* The pressure shown for 2020 and 2019 is a bottom hole pressure calculated based on surface pressure and a fluid gradient. This pressure is being compared to the extrapolated reservoir pressures from previously completed Falloff Test. The comparison is being used to gauge the current condition of the injection interval to ensure the interval is suitable for continued injection operations.

Conclusions:

Based on the above analysis and results comparison, Agua Moss believes the Sunco SWD #1 2020 RPE was successfully completed. The results do not show indications of concern in continuing the current waste injection operations. The calculated BHP from the test was less than previous FOT extrapolated reservoir pressures. This lower pressure is due to the low volume injected this year and indicates that the reservoir is still very suitable for continued injection.

**Re: Sunco Disposal #1
Injection Water Quarterly Monitoring
2nd Quarter 2020**

Dear Ms. Murray:

This report summarizes the sample collection, field screening, and laboratory analysis of the injection water at the Agua Moss LLC Sunco Disposal #1 well for the 2nd Quarter 2020. Injection water of the Class I Sunco Disposal #1 well is assessed on a quarterly basis in accordance with 20.6.2.5207(B) NMAC.

Field Activities

Rule Engineering, LLC (Rule) personnel collected one injection water sample (S-14) from the process line inside the pump building at the location on June 5, 2020. Injection water was discharged directly from the valve of the process line into laboratory sample containers and a clean container for field screening.

Sample Collection and Field Screening Procedures

The injection water sample (S-14) was field screened for time sensitive parameters including pH, temperature, reduction potential, specific conductance, and total dissolved solids. Field screening was conducted utilizing a handheld water quality meter calibrated on the day of use with laboratory grade standards.

The sampled injection water was placed into laboratory supplied containers, labeled, and maintained on ice until delivery to Hall Environmental Analysis Laboratory in Albuquerque, New Mexico.

Field Screening and Laboratory Analytical Results

The field screening and laboratory analytical results are summarized in the attached Table 1.

QA/QC Considerations

Field measurements for time sensitive parameters including pH, temperature, reduction potential, and specific conductance more accurately reflect the characteristics of the injection water than laboratory results for these parameters due to their rapidly changing nature when removed from the stable environment of

the process line. The hold time qualifier is indicated on the laboratory report for pH as the hold time of 15 minutes from collection was exceeded during transport prior to analysis. Similarly, the hold time was exceeded for reduction potential, phosphorus as orthophosphate, reactive sulfide, and corrosivity by pH.

A dilution due to matrix qualifier is indicated on the laboratory report for total dissolved solids.

Data Evaluation

Laboratory analytical results report all constituent concentrations below the maximum concentration of contaminants for the toxicity characteristic per 40 Code of Federal Regulations (CFR) 261.24 Table 1 except for benzene. The Sunco Disposal #1 accepts both Class I non-hazardous fluids and Class II exempt oil and gas fluids. The Sunco Disposal #1 therefore occasionally receives Class II fluids with common oil and gas associated constituents, such as benzene, at concentrations in excess of the toxicity characteristic concentrations.

The M5200 pressure transducers from the Microfused line of MEAS, with their modular design, offer maximum flexibility for different configurations. This latest series sets a new price performance standard for demanding commercial and heavy industrial applications. This series is suitable for measurement of liquid or gas pressure, even for difficult media such as contaminated water, steam, and mildly corrosive fluids.

The wetted material is made of either 17-4 PH or 316L stainless steel and the transducer's durability is excellent with no welds or organics exposed to the pressure media. The M5200 is weatherproof and exceeds the latest heavy industrial CE requirements including surge protection. The circuit is protected from reverse wiring at input and short circuit at output.

This product is geared to the OEM customer for low to mid volumes. MEAS stands ready to provide a custom design of the M5200 where the volume and application warrants. Additional configurations not listed are either available or possible. Please inquire for further information.

Note: Transmitter of gage pressure type requires vent to atmosphere on the pressure reference side. This is accomplished via cable from the transmitter (the end of the cable should be terminated to clean and dry area) or through the customer mating connector/cable assembly which has internal vent path.
