Figure 1 shows the results of the regression analysis. The dependent variable is the number of days of absence from work due to illness. The independent variables are the age, sex, and education of the respondent, the number of children in the household, the number of hours worked per week, the number of days of absence from work due to illness in the previous year, and the number of days of absence from work due to illness in the previous year squared. The results show that the number of days of absence from work due to illness increases with age, sex, and education. The number of children in the household and the number of hours worked per week also have a positive effect on the number of days of absence from work due to illness. The number of days of absence from work due to illness in the previous year has a positive effect on the number of days of absence from work due to illness in the current year, but the effect is smaller for those who have been absent from work due to illness in the previous year.
