Wayne,

I can't remember if I responded to this, but to confirm...Chevron is handling the existing groundwater remediation issue at the Buckeye Compressor Station GW-29. This includes only the current groundwater issues related to historical activities and not necessarily any subsequent release in the future. Please give me a call if you need additional information.

Thanks
Matt

Dear Mr. Hudson:

Please provide OCD an E-mail stating that Chevron will be handling the groundwater issue at the site mentioned below.

Dear Mr. Price,

I have contacted the project manager at Chevron who has the Targa Buckeye Compressor Station site. The project manager's name is Matt Hudson and he said that he would be happy to send a written commitment for the groundwater clean up if he received a written request from the OCD. I do not know if a written request from the OCD has already been sent, or if one needs to be drafted so that Chevron can provide their written commitment. Below is the address for Matt Hudson, or if you prefer to send the request to me so that I could forward it on my

address is also included. Please copy me and Mr. Cal Wrangham (CWrangham@targaresources.com) on any correspondence with Matt Hudson or Chevron. Please let me know if I can be of any more assistance. Thank you.

Sincerely,

Kristen Stevenson

Subject: Buckeye Compressor Station GW-29

Dear Mr. Price,

In response to your e-mail to Mr. Cal Wrangham, regarding the groundwater contamination at the Targa Buckeye Compressor Station, I have faxed two letters to Mr. VonGonten detailing Texaco/Chevron's agreement to be responsible for the groundwater contamination. I talked with Mr. VonGonten on July 17, 2007 and faxed the letters shortly after our phone conversation. Mr. VonGonten said that he would have to review the documents and then proceed from there. Please let me know if I can be of any more assistance. Thank you.

Sincerely,

Dear Cal,

After reviewing your recently approved DP we noticed you were suppose to provide us an update on the groundwater contamination. In addition, Chevron was in for a meeting and this discussion came up. Until OCD receives verification from all parties on who is handling the contamination Targa will be responsible. I am sure this was worked out but OCD need verification so we may split the permit.

Thanks

NOTICE OF PUBLICATION

STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge permit application(s) has been submitted to the Director of the Oil Conservation Division, 1220 S. Saint Francis Drive, Santa Fe, New Mexico 87505, Telephone (505) 476-3440:

(GW-029) – Dynegy Midstream Services, LP, Cal Wrangham, 6 Desta Drive, Suite 3300, Midland, Texas 79705, has submitted an application for renewal of its previously approved discharge plan for its Buckeye Gas Processing Plant located in the NE/4 SE/4 and SW/4 SW/4 of Section 36, township 17 South, Range 34 East and the NE/4 NE/4 and SW/4 NE/4 of Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico. Approximately 17,000 gallons per day of process wastewater with a total dissolved solids concentration of 1,300 mg/l is disposed of at OCD permitted offsite Class II injection wells. Ground water most likely to be affected by any accidental discharge is at a depth of approximately 120 feet and has a total dissolved solids content of approximately 360 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge permit application and draft discharge permit may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. The draft discharge permit may also be viewed at OCD's web site http://www.emnrd.state.nm.us/ocd/. Prior to ruling on any proposed discharge permit or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed permit based on information available. If a public hearing is held, the director will approve or disapprove the proposed permit based on information in the permit and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 30th day of November 2005.

Subject: Groundwater Investigation- Buckeye Compressor Station GW-029

Dear Mr. Bailey:

The OCD is in receipt of the groundwater investigation work plan dated April 12, 2002 submitted by Larson & Associates, Inc. The OCD hereby approves of the plan with the following conditions:

1. Notify the OCD Santa Fe office and the OCD District office at least 72 hours in advance of all scheduled activities such that the OCD has the opportunity to witness the events and/or split samples during OCD's normal business hours.

2. Submit the results of the investigation by July 19, 2002.

Please be advised that NMOCD approval of this plan does not relieve Chevron-Texaco or Dynegy of liability should their operations fail to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD approval does not relieve Chevron-Texaco or Dynegy of responsibility for compliance with any other federal, state, or local laws and/or regulations.

Re: Groundwater Investigation Work Plan, Buckeye Compressor Station (GW-029), Unit Letter O (SW/4, SE/4), Section 36, Township 17 South, Range 34 East, Lea County, New Mexico

Dear Mr. Price:
Texaco Exploration and Production Inc. (Texaco), former operator of the Buckeye Compressor Station (Site), has retained Larson and Associates, Inc. (LA) to prepare a work plan to investigate the source and extent of dissolved benzene that was reported in a sample from a well at the Site. The benzene impact was detected during renewal of the groundwater discharge plan (GW-029). This letter presents the groundwater investigation plan that was requested by the New Mexico Oil Conservation Division (NMOCD) on January 17, 2002. Figure 1 presents a Site location and topographic map. Figure 2 presents Site Details.

PROPOSED INVESTIGATIONS

Proposed Investigation Areas
In order to effectively investigate the source and extent of benzene impact at the Site, soil borings will be installed in the following locations:

- North (BH-3) and south (BH-2) of the Slop Oil Tanks,
- North of the Metering Skid and Chevron Sales Pumps (BH-4),
- North of the Storage Area (BH-5),
- North of the Condensate Storage area (BH-6),
- North, south, east and west of the Skimmer Pit (BH-7, BH-8, BH-9 and BH-10),
- North of the Salt Bed and Hot Oil Heaters (BH-11),
- North of the Compressor Building (BH-12, BH-13 and BH-14),
- South of the Compressor Building (BH-15), and
- West of the Glycol Regeneration Area (BH-16).

Additionally, one soil boring (BH-1), to represent background conditions, will be installed to the south of the Site.

Monitoring wells will be installed at the following locations:

- Southeast corner of the site (MW-1),
- North of the skimmer pit (MW-2),
- North of the Dehydrator Skids (MW-3),
- Outside the northeast fence line (MW-4),

- North of the northern fence line (MW-5),
- North of the Compressor Building (MW-6 and MW-7), and
- West of the Cooling Tower (MW-8).

Soil Borings

Approximately sixteen (16) soil borings will be installed at the Site to determine potential sources for the benzene impact. Figure 2 presents the locations for the proposed borings. The borings will be drilled using a truck-mounted air rotary drilling rig. The soil samples will be collected using a split-spoon sampler or equivalent device for geological descriptions and possible laboratory analysis. Each soil sample will be placed in a clean glass sample container, labeled, chilled in an ice chest, and delivered under chain-of-custody control to an environmental laboratory. A portion of each sample will be collected in a separate glass sample jar for soil headspace gas analysis using the ambient temperature headspace (ATH) method. The ATH method involves placing a soil sample in a clean glass sample jar to approximately ¾ full, sealing the top of the jar with aluminum foil before replacing the cap. After approximately 15 minutes at ambient temperature the concentration of organic vapors in the headspace of the sample jar is measured with a photoionization detector (PID). The probe of the PID is passed through the aluminum foil and measures the concentration of ionizable hydrocarbons in the headspace vapors. The NMOCD allows a PID measurement of 100 parts per million (ppm) or less to be substituted for a laboratory analysis of benzene, toluene, ethylbenzene, and xylene (commonly referred to as BTEX). The NMOCD requires laboratory confirmation for BTEX when a PID measurement exceeds 100 ppm.

However, headspace analysis cannot replace a laboratory analysis for total petroleum hydrocarbons (TPH). A soil sample will be collected at the surface at each location, and every ten (10) feet thereafter until observed impacts diminish or groundwater is encountered. Initially, the sample exhibiting the highest PID reading, and deepest sample from each boring will be analyzed for TPH and chloride. The samples will also be analyzed for BTEX if PID readings exceed 100 ppm, and additional samples may be analyzed to characterize potential impacts. The analysis will be compared to the Recommended Remediation Action Levels established by the NMOCD to determine the need for remediation. A geologic log will be prepared for each boring that graphically displays the PID readings.

The sample exhibiting the highest TPH concentration will be analyzed for the primary New Mexico Water Quality Control Commission (WQCC) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) to determine potential impacts to soil. The laboratory results will be compared to background and soil screening levels established by the New Mexico Environment Department (NMED) for these compounds. Additional samples may be analyzed if the reported concentrations exceed the soil screening levels. Drill cuttings will be placed on the ground adjacent to the borings until the laboratory analyses are received, and disposal is arranged. All down-hole equipment (i.e., drilling rods, bit, etc.) will be thoroughly decontaminated between each use with a high-pressure hot water wash and rinse. All soil sampling equipment (i.e., split-spoon sampler, samples trowels, etc.) will be thoroughly washed between events with potable water and laboratory-grade detergent and rinsed with distilled water.

Monitoring Wells

Texaco proposes to install eight (8) monitoring wells at the Site. The proposed well locations are presented on Figure 2. The anticipated groundwater flow direction is from south to north, and groundwater occurs at about 125 feet below ground surface (BGS), based on depth-to-groundwater measured in nearby monitoring wells. Depth-to-groundwater at the Site may vary due to draw down from the water well located at the Site. The monitoring wells may be drilled to about 140 feet BGS, however, the final well depths will be determined from field observations. An air-rotary drilling rig will be used to drill the wells, and soil samples will be collected using a split-spoon or equivalent sampling device at intervals previously described. The soil samples will be field screened using the ATH method previously described. The sample exhibiting the highest PID reading, and sample collected immediately above the groundwater level observed during drilling will be analyzed for TPH and chloride. The samples may also be tested for BTEX if PID readings exceed 100 ppm. Additional samples may be tested as necessary to define the vertical extent of a potential impact.

The monitoring wells will be constructed with 2-inch diameter schedule 40 PVC casing and screen. Approximately 20 feet of well screen will be placed in each well, with approximately 15 feet of screen extending into groundwater, and 5 feet extending above groundwater. Silica sand will be placed around the well screen to about 2 feet above the screen. A layer of bentonite pellets, approximately 2 feet thick, will be placed over the sand, and hydrated with potable water. The remainder of the annulus will be filled with cement and bentonite grout, to about one (1) foot below ground. Each well will be secured with an above-grade locking steel cover anchored in a concrete pad measuring approximately 3 feet by 3 feet. The monitoring wells and water well will be surveyed by a Professional Land Surveyor registered in the State of New Mexico. The wells will be surveyed for horizontal location, top-of-casing and ground elevations.

The wells will be bailed after installation to remove fine-grained sediment disturbed during drilling. Additional development will be performed using an electric submersible pump and dedicated polyethylene tubing. The purged water will be contained in a portable tank, and placed in the produced water injection system at the Vacuum Field Unit operated by Texaco. All equipment contacting groundwater (i.e., water level indicator, interface probe, submersible pump, etc.) will be thoroughly cleaned and rinsed between wells using laboratory-grade detergent.

Groundwater samples will be collected from all wells, including the monitoring wells and water well, and analyzed for BTEX, dissolved WQCC metals, anions, cations, and TDS. Depth-to-groundwater will be measured in the water well and monitoring wells before the wells are purged and sampled. Groundwater samples will be collected using dedicated disposable polyethylene bailers, and carefully poured into laboratory-prepared containers. Samples for dissolved metals analysis will be filtered using dedicated 0.45-micron disposable filters before placement in the laboratory-prepared container, and preservation. The sample containers will be labeled, immediately chilled in an ice chest, and transferred under chain-of-custody control to the laboratory. A duplicate sample and trip blank will be collected for Quality Assurance/Quality Control (QA/QC). The field observations will be documented in a bound field notebook, and a construction diagram and geologic log will be prepared for each monitoring well.

A review of New Mexico State Engineer records will be performed to determine the construction of the water well. The records review will also include water wells within 0.5 miles of the Site to determine possible receptors. A final report will be submitted to the NMOCD following completion of the investigation, and will include summaries of field and laboratory data, a groundwater flow diagram, and isopleth maps of various parameters exhibited in groundwater above regulatory limits. Please call Mr. Rodney Bailey at (915) 687-7100 or myself at (915) 687-0901 if you have questions.

Sincerely,
Larson & Associates, Inc.

Re: Water Well Impact and Groundwater Investigation Work Plan, Buckeye Compressor Station (GW-029), Lea County, New Mexico

Dear Mr. Price:
Texaco Exploration and Production Inc. (Texaco) has requested Larson and Associates, Inc. (LA) to prepare a work plan to perform a groundwater investigation at the Buckeye Compressor Station (Site). Dynegy Midstream Services, L.P. (Dynegy) reported an elevated benzene level in a sample collected from the water well during renewal of the groundwater discharge plan (GW-029). Texaco will be responsible for the investigation in accordance with an agreement when it merged its interest in the Site with Dynegy (Versado Gas Processors, L.P.). LA will prepare a work plan in accordance with the communication between the NMOCD and Dynegy (electronic mail) dated January 17, 2002. Please call Mr. Rodney Bailey with ChevronTexaco Inc. at (915) 687-7100 or myself at (9150 687-0901 if you have questions.
Sincerely,
Larson and Associates, Inc.

Dear Mr. Wrangham:

The OCD is in receipt of Larson @ Associates Inc. plan dated July 25, 2001. The OCD hereby approves of the plan and requires
Dynegy to submit for OCD approval a Groundwater Investigation Plan by April 15, 2002.

Please be advised that NMOCD approval of this plan does not relieve Dynegy of liability should their operations fail to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD approval does not relieve Dynegy of responsibility for compliance with any other federal, state, or local laws and/or regulations.

RE: GW-029
Buckeye Compressor Station
Discharge Plan Renewal

Dear Sir:
Please find attached a check ($1700.00) for the discharge plan renewal flat fee and the signed approval conditions. I would like to thank you and your staff for the professional and courteous manner in which you have guided us through this process.

Please call with any questions or concerns. (915) 688-0542.

Sincerely,

Cal Wrangham

Subject: Dynegy Discharge Plans

Because of the resent pending policy changes on used filter disposal Dynegy requests to revise NMOCD Discharge Plans. This includes permit # GW-003, 004, 005, 025, 026, 027, and 029. The Discharge Plans Waste Management Sections list the used filters to be transported and disposed of by Waste Management Inc. at the Lea County landfill. Dynegy would like to utilize E&E Environmental, PO Box 683, Brownfield TX. 79731. E&E will transport the filters to their Childress,Texas facility for processing/recycling. The filters are a non-hazardous waste stream.

LEGAL NOTICE
NOTICE OF PUBLICATION
STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge plan application has been submitted to the Director of the Oil Conservation Division, 2040 South Pacheco, Santa Fe, New Mexico 87505, Telephone (505) 827-7131:

(GW-029) - Dynegy Midstream Services, LP, Cal Wrangham, 6 Desta Drive, Suite 3300, Midland, Texas 79705, has submitted an application for renewal of its previously approved discharge plan for its Buckeye Gas Processing Plant located in the NE/4 SE/4 and SW/4 SW/4 of Section 36, Township 17 South, Range 34 East and the NE/4 NE/4 and SW/4 NE/4 of Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico. Approximately 17,000 gallons per day of process wastewater with a total dissolved solids concentration of 1,300 mg/l is disposed of at OCD permitted offsite Class II injection wells. Ground water most likely to be affected by any accidental discharge is at a depth of approximately 120 feet and has a total dissolved solids content of approximately 360 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan application may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed plan based on information available. If a public hearing is held, the Director will approve or disapprove the proposed plan based on the information in the discharge plan application and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 23rd day of October, 2000.

Discharge Plan GW-029 Renewal
Buckeye Compressor Station

Gentlemen:

Dynegy Midstream Services, L. P. would like to renew the Buckeye Compressor Station Discharge Plan as required by WQCC Sec. 3106.

Please find the attached:
1) The renewal form and a check in the amount of $50.00, which constitutes our filing fee for the Discharge Plan renewal.
2) The updated Spill Prevention Control and Countermeasure Plan.
3) The updated sources of effluent and waste solids (Waste Stream List).

Please call me with any questions, Office (915) 688-0542 Cellular (915) 425-7072.

Sincerely,

Cal Wrangham

DISCHARGE PLAN APPLICATION FOR SERVICE COMPANIES,GAS PLANTS. REFINERIES, COMPRESSOR, AND CRUDE OIL PUMP STATIONS

(Refer to the OCD Guidelines for assistance in completing the application)

☐ New ☒ Renewal ☐ Modification

1. Type: Buckeye Compressor Station

2. Operator: Dynegy Midstream Services, L. P.

   Address: PO Box 67 Monument, NM 88265 (from Hobbs take US 62 west to NM 529 (west). Turn right (north) at NM 238 approximately 5 miles to plant on left)

   Contact Person: Cal Wrangham Phone: (915) 688-0542

3. Location: /4 /4 Section 36, 1 Township 17, 18 South Range 34 East
   Submit large-scale topographic map showing exact location.

4. Attach the name, telephone number and address of the landowner of the facility site.
   Versado Gas Processors, L. L. C., 1000 Louisiana Street, Houston, TX. 77002

5. Attach the description of the facility with a diagram indicating location of fences, pits, dikes and tanks on the facility.
   See on file at OCD.

6. Attach a description of all materials stored or used at the facility. **See on file at OCD**

7. Attach a description of present sources of effluent and waste solids. Average quality and daily volume of wastewater must be included. **See attached Waste Stream document.**

8. Attach a description of current liquid and solid waste collection/treatment/disposal procedures.
   See on file at OCD .

9. Attach a description of proposed modifications to existing collection/treatment/disposal systems.
   None.

10. Attach a routine inspection and maintenance plan to ensure permit compliance. **See on file at OCD**

11. Attach a contingency plan for reporting and clean-up of spills or releases. **See attached SPCC Plan.**

12. Attach geological/hydrological information for the facility. Depth to and quality of ground water must be included.
    See on file at OCD

13. Attach a facility closure plan, and other information as is necessary to demonstrate compliance with any other OCD rules, regulations and/or orders. **See on file at OCD**

14. CERTIFICATIONI hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

Monument – Buckeye Compressor Station
DATA SHEET

PART I
GENERAL INFORMATION

1. Name of facility: **Monument - Buckeye Compressor Station**

3. Location of facility: From Hobbs, NM take US 62 west to NM 529 (west). Turn right (north) at NM 238 approximately 5 miles to plant on left..

7. Potential Spills – Prediction & Control: **See Table 1.**

Discussion:
The map referred to in the Generic SPCC Plan is attached here as Figure 1.

8. Containment or diversionary structures or equipment to prevent oil from reaching navigable waters are practicable: **Yes, for tanks.**

PART II
DESIGN AND OPERATING INFORMATION

A. Facility Drainage

2. Drainage from undiked areas is controlled as follows (include description of ponds, lagoons, or catchment basins and methods of retaining and returning oil to facility):

Drainage from undiked areas generally flows to the southeast. Any oil released to this area will be absorbed with booms or other similar equipment.

B. Bulk Storage Tanks

2. Describe secondary containment design, construction materials, and volume:

All tanks within the plant are located inside concrete or earth secondary containment structures. Containment structures are generally designed to hold the capacity of the largest tank within the structure plus excess capacity for the 25-year, 24-hour rainfall event. Dimensions of all containment structures are listed in Table 1. Capacities of these structures are calculated in Table 2.

D. Facility Tank Car & Tank Truck Unloading Rack
Tank car and tank truck unloading occurs at the facility. **Yes**

1. Unloading procedures meet the minimum requirements and regulations of the Department of Transportation **Yes**

2. The unloading area has a quick drainage system. **N/A**

3. The containment system will hold the maximum capacity of any single compartment of a tank truck unloaded in the Facility: **N/A**

Describe containment system design, construction materials, and volume:

N/A

4. An interlocked warning light, a physical barrier system, or warning signs are provided in loading/unloading areas to prevent vehicular departure before disconnect of transfer lines.
Yes, signs are provided at each facility and contractors are required to follow the following procedure.

Describe methods, procedures, and/or equipment used to prevent premature vehicular departure:

- ☐ Contractors are responsible for wearing appropriate Personal Protective Equipment (PPE) required by facility (hard hat, safety glasses, fire retardant clothing). If driver is unfamiliar with the product being loaded, obtain a Material Safety Data Sheet (MSDS) from Dynegy.
- ☐ Truck driver to call local Dynegy personnel before beginning loading/unloading operation described below.
- ☐ Driver pulls truck to designated loading/unloading area with approval from local Dynegy personnel.
- ☐ With truck shut down, driver will attach ground cable and chock wheels.
- ☐ Driver will visually inspect hoses for cracks or defects. If no defects are noted, driver will attach hoses and assure that connections are secure.
- ☐ Record meter reading (where applicable) or gauge tank level prior to loading or unloading.
- ☐ Remove padlocks from valves where applicable.
- ☐ Open valves required to load or unload.
  After the tank is full (or empty) gauge the tank (or read the meter). Record the readings and reverse the procedure above.
- ☐ Driver to fill out appropriate DOT paperwork and provide receipt ticket/copy of paperwork to Dynegy.
- ☐ If a spill occurs during the loading/unloading operation, call the local Dynegy representative immediately at the emergency number shown on the facility sign.

5. Drains and outlets on tank trucks and tank cars are checked for leakage before unloading or departure. **Yes**

Attachments:

Figure 2 – Lube Oil Tank

Figure 3 – Slop oil Tanks

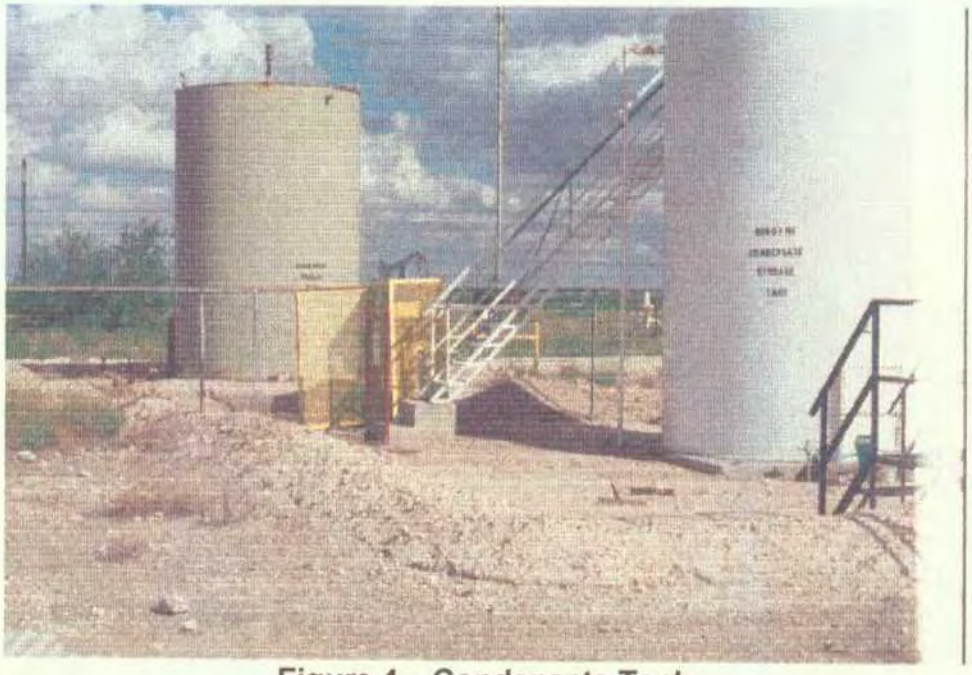

Figure 4 – Condensate Tank

Applicability of Substantial Harm Criteria

1. Does the facility transfer oil over water to or from vessels and does the facility have a total oil storage capacity greater than or equal to 42,000 gallons? **No**

2. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and does the facility lack secondary containment that is sufficiently large to contain the capacity of the largest aboveground oil storage tank plus sufficient freeboard to allow for precipitation within any aboveground oil storage tank area? **No**

3. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula1) such that a discharge from the facility could cause injury to fish and wildlife and sensitive environments? **No**

4. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and is the facility located at a distance (as calculated using the appropriate formula in Attachment C-III to this appendix or a comparable formula) such that a discharge from the facility would shut down a public drinking water intake? **No**

5. Does the facility have a total oil storage capacity greater than or equal to 1 million gallons and has the facility experienced a reportable oil spill in an amount greater than or equal to 10,000 gallons within the last 5 years? **No**

Dike Calculations
Monument – Buckeye Compressor Station

Tank / Dike Combination	Dike Full Storage Volume (see Table 1 for dimensions), gal.	Largest Tank capacity (gal)	Available Dike Full Precipitation Storage (in.)
1	13,449	21,000	NA
2,3	24,235	10,500	10.2
4	17,503	8,820	8.9

WQCC 3106.F. If the holder of an approved discharge plan submits an application for discharge plan renewal at least 120 days before the discharge plan expires, and the discharger is not in violation of the approved discharge plan on the date of its expiration, then the existing approved discharge plan for the same activity shall not expire until the application for renewal has been approved or disapproved. A discharge plan continued under this provision remains fully effective and enforceable. An application for discharge plan renewal must include and adequately address all of the information necessary for evaluation of a new discharge plan. Previously submitted materials may be included by reference provided they are current, readily available to the secretary and sufficiently identified to be retrieved. [12-1-95]

Discussion: Discussed WQCC 3106F and gave notice to submit Discharge Plan renewal application with $50.00 filing fee for the above listed facilities.

Conclusions or Agreements:
***** OCD will honor the WQCC 3106.F if plan and filing fee is submitted by October 15, 2000 for the GW-029 facility.**

Mr. Bill Olson
Hydrologist
Environmental Bureau
Oil Conservation Division
2040 South Pacheco
Santa Fe, New Mexico 87505

Dear Mr. Olson,

On June 4, 1998, Mr. Robert Browning telephoned notice of possible groundwater impacts at Texaco Exploration & Production Inc.'s (TEPI) Buckeye Gas Plant. This was followed up on June 12, 1998 with written notification to the Oil Conservation Division's Hobbs office. Several lab samples of the water from the plant's water well showed levels of benzene in excess of the State standards. TEPI is now in the process of reviewing the data and investigating the source.

We understand there has been a history of problems with oil and gas produced water disposal wells in the vicinity of the Buckeye Gas Plant. The source of the benzene found in our fresh water well is not clear. There have been several investigations, data gathering and reports on this matter. We are currently in the process of obtaining this material for review. In addition, we are pursuing additional sampling that may "fingerprint" the source of the contamination in our water well. We will keep you posted on our progress and investigation plans. We should have this completed by September 1, 1998.

As you may be aware, TEPI and Dynegy (formerly NGC/Warren Corp.) are merging our respective gas processing assets in Lea County. We are forming a joint-venture company to be called Versado Gas Processors, L.L.C. The Buckeye Gas Plant will be part of this joint-venture. As part of our joint-venture agreement, Texaco will be responsible for most environmental issues resulting from Texaco operations prior to the formation of the joint-venture. This includes the Buckeye Gas Plant groundwater investigation. This joint-venture does not include the Texaco oil and gas producing operations based out of Hobbs, New Mexico.

We are currently in transition to the new company. Both Texaco and Dynegy key personnel are leaving to assume employment with Versado, others are retiring, and still others are transferring back to the parent companies. Over the next 60-90 days, we should have our final staff in place. Since Texaco Gas Plants Operating Unit will no longer have any offices in the Eunice-Hobbs areas, the Buckeye groundwater investigation as well as the ongoing Eunice North and South investigation and remediation work will be coordinated out of our Denver office.

Thank you for your consideration. If you have any questions or require any further information, please contact Mr. Robert W. Foote at 303-793-4959.

Sincerely,

Roy W. Hamilton
Gas Plant Operating Unit Manager

Plant

Addendum #1

Waste Sludge, leaking lube oil from plunger pumps, and oil soaked soil is mixed with caliche to soak up the oil. The oily soil is then removed to the east side of the plant where it is **stored in a sealed container then removed to a permitted facility (NMOCD approved).**

Addendum #2

Additionally, the plant plans to leak test all buried wastewater lines within 1 year from this date. All pressurized lines will be hydrostatically tested at **3 psia above their operating pressure**. Open-end lines will be tested by pneumatic or other acceptable non-destructive testing techniques. Records of the leak testing will be maintained in the plant files.

Plant Manager Date 02-22-96

a special waste container provided by Waste Management of Southeast New Mexico and removed for disposal at the City of Hobbs Landfill.

Waste Sludge, leaking lube oil from plunger pumps, and oil soaked soil is mixed with caliche to soak up the oil. The oily soil is then removed to the east side of the plant where it is landfarmed and remediated.
(See Addendum #1)

Should a spill or leak occur, any contaminated soil is removed and disposed of in accordance with applicable local, state, and federal regulations.

3. Leak Detection: The plant operators conduct hourly walk-through inspections of the entire facility. If a leak is discovered the plant operator will initiate corrective action. In the event of a serious or catastrophic leak the plant operator may initiate emergency procedures as outlined in Item II.D.1.

   Any problems encountered are noted in the operators log book.

   Additionally, the plant plans to leak test all buried wastewater lines within 1 year from this date. All pressurized lines will be hydrostatically tested at 1.5 times their operating pressure. Open-end lines will be tested by pneumatic or other acceptable non-destructive testing techniques. Records of the leak testing will be maintained in the plant files.
   (See Addendum #2)

4. Injection Wells: See Item III.A.2

III. Effluent Disposal

A. Existing Operations

1. On-site Facilities: Texaco's Buckeye Gas Processing Plant does not utilize on-site disposal facilities.

2. Off-Site Facilities

   a) Sludges and Solids-The plant disposes of sludges and solids on an as needed basis. When disposal is required, the transporter and disposal site utilized will meet all local, state, and federal requirements.

   b) Wastewater - All of the plant's wastewaters are disposed of in Texaco Exploration and Production Inc.'s (TEPI) Vacuum Glorietta

West Unit Waterflood System. The wastewater is pumped from the plant's slop oil pit through a 2" carbon steel line to a 3" polypipe line that is owned by TEPI. TEPI receives the wastewater into a 3-phase separator at Vacuum Glorietta West Unit Satellite #3. The wastewater is then injected into any of several Class II injection wells located in Sections 1, Township 18 South, Range 34 East and in Sections 35 and 36, Township 17 South, Range 34 East.

The injection wells and the waterflood project are operated by:

Texaco Exploration and Production, Inc.
West Star Route, Box 423
Lovington, NM 88260

B. Proposed Modifications: Not applicable.

IV. SITE CHARACTERISTICS

A. Hydrological Features

1. There are no known bodies of water, streams or other watercourses within one mile of the Buckeye Gas Processing Plant.

   There are ten know freshwater wells within a one mile radius of the plant:

   - Texaco Exploration and Production Inc. VGSA Unit D Well #3 Section 1, Township 18 South, Range 34 East.
   - Texaco Exploration and Production Inc. VGSA Unit Well #2 Section 2, Township 18 South, Range 34 East
   - Texaco Exploration and Production Inc. field office, Section 1, Township 18 South, Range 34 East
   - Texaco Exploration and Production Inc. CVU Extraction Well #1, Section 1, Township 18 South, Range 34 East
   - Texaco Exploration and Production Inc. CVU Extraction Well #2, Section 1, Township 18 South, Range 34 East
   - Texaco Exploration and Production Inc. CVU Well #3 Section 6, Township 18 South, Range 35 East

- Texaco Exploration and Production Inc. CVU WSW #2, Section 6, Township 18 South, Range 35 East

- Texaco Exploration and Production Inc. Buckeye Gas Processing Plant, Section 36, Township 17 South, Range 34 East
- New Mexico Potash Corporation Well #8, Section 31, Township 17 South, Range 34 East.

- New Mexico Potash Corporation, Section 31, Township 17 South, Range 34 East.

Two of the wells, Texaco Exploration and Production Inc.'s CVU Extraction Wells #1 and #2, are used for a groundwater remediation project. The Texaco Exploration and Production Inc. field office well is used for office water(toilets and sinks). All other wells are used for industrial purposes.

2. The depth to the first usable aquifer, the Ogallala aquifer, averages 115-120 feet. On December 12, 1995 the plant's water well was sampled for water quality analyses. The analyses are included in Appendix 2.

3. During a 1989/1990 groundwater contamination study, conducted by the New Mexico Oil Conservation Division and Texaco Exploration and Production Inc., the groundwater flow direction was determined to be from the northwest to the southeast. A groundwater flow contour drawing has been included as Appendix 5.

B. Geological Description of Discharge Site

A geological description of the discharge site can best be described by including an excerpt from:

Groundwater Contamination Study
Texaco CVU WSW #3
Vacuum Field, Buckeye
Lea County, New Mexico

by Eddie W. Seay
New Mexico Oil Conservation Division
Hobbs, New Mexico
1989-1990

Site Geology

Geographically, the site is situated near the western boundary of the southern extension of the High Plains in Southeastern New Mexico.

Topographically, the Southern High Plains, a plateau, rises approximately 100 to 300 feet above the surrounding region and slopes to the Southwest at 10 to 20n feet per mile.

The formation of interest in this area was the DacCum group, or "Redbed" and the Ogallala. The relatively impermeable shale faces of the upper portion of the Triassic Redbed represent the lower limit of the overlying Ogallala aquifer.

The Triassic Redbeds are composed of red to reddish brown mudstone with minor interbedded sandstone. This clay formation which underlies the fresh water aquifer is very irregular, varying in depth as much as fifty feet. Where the redbeds are exposed to the surface, it appears the changes and irregularities are due to stream erosion. these ridges and channels along with the southeastward dip of the redbed surface control the direction and movement of ground water in the lower portion of the "Ogallala" formation.

C. Flood Protection

After an exhaustive search of governmental agencies, specific flooding information could not be located. However, during the 30 year operating history of the plant there have been no known flooding events.

The annual rainfall totals from the nearest recording station in Lovington, New Mexico are:

Year	Rainfall in inches
1985	23.05
1986	16.45
1987	18.22
1988	17.80
1989	9.20
1990	11.55
1991	24.70
1992	19.95
1993	8.70
1994	8.95

ATTACHMENT TO THE DISCHARGE PLAN GW-029 APPROVAL
TEXACO BUCKEYE GAS PROCESSING PLANT
DISCHARGE PLAN REQUIREMENTS
(February 14, 1996)

1. Payment of Discharge Plan Fees: The $1,667.50 flat fee shall be submitted upon receipt of this approval. The required flat fee may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the plan, with the first payment due upon receipt of this approval.

2. Texaco Commitments: Texaco will abide by all commitments submitted in the Renewal application letter dated January 9, 1996 from Texaco as well as the following OCD approvals; Discharge plan approval dated January 16,1986, discharge plan renewal dated April 24, 1991.

3. Drum Storage: All drums containing materials other than fresh water must be stored on an impermeable pad and curb type containment (i.e. concrete, asphalt, or other suitable containment). All empty drums should be stored on their sides with the bungs in place and lined up on a horizontal plane. Chemicals in other containers such as sacks or buckets should also be stored on an impermeable pad and curb type containment.

4. Process Areas: All process and maintenance areas which show evidence that leaks and spills are reaching the ground surface must be either paved and curbed or have some type of spill collection device (i.e. drip pan) incorporated into the design.

5. Above Ground Tanks: All above ground tanks which contain fluids other than fresh water must be bermed to contain a volume of one-third more than the total volume of the largest tank or of all interconnected tanks. All new facilities or modifications to existing facilities must place the tank on an impermeable type pad.

6. Above Ground Saddle Tanks: Above ground saddle tanks must have impermeable pad and curb type containment unless they contain fresh water or fluids that are gases at atmospheric temperature and pressure.

7. Tank Labeling: All tanks should be clearly labeled to identify their contents and other emergency information necessary if the tank were to rupture, spill, or ignite.

8. Below Grade Tanks/Sumps: All below grade tanks, sumps, and pits must be approved by the OCD prior to installation or upon modification and must incorporate secondary containment and leak-detection into the design. All pre-existing sumps and below-grade tanks must demonstrate integrity on an annual basis. Integrity tests include pressure testing to 3 pounds per square inch above normal operating pressure and/or visual inspection of cleaned out tanks /or sumps.

9. Underground Process/Wastewater Lines: All underground process/wastewater pipelines must be tested to demonstrate their mechanical integrity at present and then every 5 years there after. Permittees may propose various methods for testing such as pressure testing to 3 pounds per square inch above normal operating pressure or other means acceptable to the OCD.

10. Class V Wells: Leach fields and other wastewater disposal systems at OCD regulated facilities which inject fluid other than sewage below the surface but into or above an underground source of drinking water are considered Class V injection wells under the EPA UIC program. All class V wells will be closed unless, it can be demonstrated that protectable groundwater will not be impacted in the reasonably foreseeable future. Class V wells must be closed through the Santa Fe Office. The OCD allows industry to submit closure plans which are protective of human health/environment, and groundwater as defined by the WQCC, and are cost effective.

11. Housekeeping: All systems designed for spill collection/prevention should be inspected to ensure proper operation and to prevent overtopping or system failure.

    Any contamianted soils that are collected at the facility will be tested for hazardous constituents, and after receiving OCD approval, will be disposed of at an OCD approved site.

12. Spill Reporting: All spills/releases shall be reported pursuant to OCD Rule 116 and WQCC 1203 to the OCD Hobbs District Office.

13. Transfer of Discharge Plan: The OCD will be notified prior to any transfer of ownership, control, or possession of a facility with an approved discharge plan. A written commitment to comply with the terms and conditions of the previously approved discharge plan must be submitted by the purchaser and approved by the OCD prior to transfer.

14. Closure: The OCD will be notified when operations of the facility are discontinued for a period in excess of six months. Prior to closure of the facility a closure plan will be submitted for approval by the Director. Closure and waste disposal will be in accordance with the statutes, rules and regulations in effect at the time of closure.

15. Conditions accepted by: C. D. Lamell (Company Representative) 2-27-96 (Date)

Plant Superintendent (Title)

NOTICE OF PUBLICATION

STATE OF NEW MEXICO

Energy, Minerals and Natural Resources Department
Oil Conservation Division

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge plan renewal application has been submitted to the Director of the Oil Conservation Division, 2040 South Pacheco, Santa Fe, New Mexico, 87505, Telephone (505) 827-7131:

(GW-029) - Texaco Exploration and Production, Inc., Ron Humphrey, West Star Route, Box 423, Lovington, New Mexico, 88260 has submitted an application for renewal of its previously approved discharge plan for its Buckeye Gas Processing Plant located in the NE/4 SE/4 and SW/4 SW/4 of Section 36, Township 17 South, Range 34 East and the NE/4 NE/4 and SW/4 NE/4 of Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico. Approximately 17,000 gallons per day of process wastewater with a total dissolved solids concentration of 1,300 mg/l is disposed of at OCD permitted offsite Class II Injection wells. Ground water most likely to be affected by any accidental discharge is at a depth of approximately 120 feet and has a total dissolved solids contect of approximately 360 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan application may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. Prior to ruling on any proposed discharge plans or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing shall be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed plan based on information available. If a public hearing is held, the director will approve or disapprove the proposed plan based on information in the plan and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 16th of January, 1996.

Dear Sir/Madam:

Please publish the attached notice one time immediately on receipt of this request. Please proofread carefully, as any error in a land description or in a key word or phrase can invalidate the entire notice.

Immediately upon completion of publication, please send the following to this office:

1. ***Publisher's affidavit in duplicate.***
2. ***Statement of cost (also in duplicate.)***
3. ***CERTIFIED invoices for prompt payment.***

We should have these immediately after publication in order that the legal notice will be available for the hearing which it advertises, and also so that there will be no delay in your receiving payment.

Please publish the notice no later than January 26, 1996.

Sincerely,

Sally Martinez

ATTACHMENTS:

Dear Mark,

Ron Humphrey with Texaco came by the office today to see if I had the list of the EPA 600 series analytical requirements you mentioned during our site inspection.

I gave Ron a copy of the WQCC list of contaminants for NM ground water standards. I told him your department will notify him of the analysis that will be recommended for him to run. We both assumed this is for the water well on site since it is not potable any more.

I also gave him a copy of the standard RCRA TCLP requirements we require for non-exempt waste streams.

Ron indicated he has only till Jan. 16, 1995 and wanted to make sure he met the deadline.

Would you mind giving him a call.

Thanks!

Re: Texaco Buckeye #2 Gas Processing Plant
Discharge Plan GW-029 Inspection Report

Dear Mr. Humphrey:

The New Mexico Oil Conservation Division (OCD) would like to thank you for your cooperation during the November 11, 1995 inspections of the Texaco Buckeye gas processing plant. Comments from the inspection conducted are as follows:

1. Drum Storage: All drums that contain materials other than fresh water must be stored on an impermeable pad with curbing. All Empty drums should be stored on their sides with the bungs in and lined up on a horizontal plane. Chemicals in other containers such as sacks or buckets should also be stored on an impermeable pad with curbing.

   The drums located on the northern boundary of the facility do not appear to meet these criteria.

2. Above Ground Tanks: All above ground tanks which contain fluids other than fresh water or alcohol must be bermed to contain a volume of one-third more than the total volume of the largest or all interconnected tanks. All new facilities or modifications to existing facilities must have the tanks placed on an impermeable pad so that leaks can be identified.

   The condensate tank does not appear to meet these criteria.

3. Above Ground Saddle Tanks: Above ground saddle tanks must have pad and curb type of containment below them unless they contain alcohol or fluids which are gases at normal atmospheric pressure and temperature. No berms are required for saddle tanks.

4. Tank Labeling: All tanks should be clearly labeled to identify their contents and other emergency information necessary if the tank were to rupture, spill, or ignite.

   There is one unidentifed drum located on the northern boundary of the facility that does not appear to meet these criteria.

5. Below Grade Tanks/Sumps: All below grade tanks, sumps, and pits must be approved by the OCD prior to installation and must incorporate secondary containment and leak-detection into the design. All pre-existing sumps and below-grade tanks must demonstrate integrity on an annual basis. Integrity tests include pressure testing and visual inspection of cleaned out tanks /or sumps.

   Please submit a method and time schedule to the OCD for integrity testing.

6. Underground Process/Wastewater Lines: All underground process/wastewater pipelines must be tested to demonstrate their mechanical integrity at present and then every 5 years thereafter. Companies may propose various methods for testing such as pressure testing or other means acceptable to the OCD.

   Please submit a method and time schedule to the OCD for integrity testing.

7. Solid Wastes: Please provide to the OCD the storage, handling, and final disposition of all solid wastes stored within the facility (ie. used mole sieve, contaminated caliche).

8. Housekeeping: All systems designed for spill collection/prevention should be inspected frequently to ensure proper operation and to prevent overtopping or system failure.

9. Spill Reporting: All spills/releases shall be reported pursuant to OCD Rule 116 and WQCC 1203 to the appropriate OCD District Office.

Please address the above areas of concern by January 1, 1996.

Once again, on behalf of the OCD, I would like to thank you for your time during our recent visit to your plant. If you have any questions, please call me at (505) 827-7155.

Sincerely,

Mark Ashley

RE: Discharge Plan GW-029 Renewal
Buckeye #2 Gas Processing Plant
Lea County, New Mexico

Dear Sir:

On January 16, 1986, the groundwater discharge plan, GW-029, for the Buckeye Gas Processing Plant located in the NE/4 NE/4, Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico, was approved by the Director of the New Mexico Oil Conservation Division (OCD). The plan was subsequently renewed on April 24, 1991. This discharge plan was required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and was approved for a period of five years. The approval will expire on January 16, 1996.

On March 21, 1995, and again on August 23, 1995 you were notified of the upcoming expiration. If the discharge plan renewal is not received and approved by the OCD by January 16, 1996, your facility will be required to cease operations until the OCD receives and approves the discharge plan renewal.

If your facility continues to have potential or actual effluent or leachate discharges and you wish to continue operation, you must renew your discharge plan. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can extend for several months. Please indicate whether you have made, or intend to make, any changes in your system, and if so, please include these modifications in your application for renewal.

Please submit the original and one copy to the OCD Santa Fe Office and one copy to the OCD Hobbs District Office. Note that the completed and signed application form must be submitted with your discharge plan renewal request.

The discharge plan renewal application for the Buckeye Gas Processing Plant is subject to the WQCC Regulations 3-114 discharge plan fee. Every billable facility submitting a discharge plan renewal will be assessed a fee equal to the filing fee of fifty (50) dollars plus a flat fee of $1667.50 for gas processing plants.

The (50) dollar filing fee is to be submitted with discharge plan renewal application and is nonrefundable. The flat fee for an approved discharge plan renewal may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the discharge plan.

Please make all checks payable to: **NMED-Water Quality Management** and addressed to the OCD Santa Fe Office.

If you no longer have any actual or potential discharges a discharge plan is not needed, please notify this office. If you have any questions regarding this matter, please do not hesitate to contact Mark Ashley at (505) 827-7155.

Sincerely,

Roger C. Anderson
Environmental Bureau Chief

RE: Discharge Plan GW-029 Renewal
Buckeye #2 Gas Processing Plant
Lea County, New Mexico

Dear Sir:

On January 16, 1986, the groundwater discharge plan, GW-029, for the Buckeye Gas Processing Plant located in the NE/4 NE/4, Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico, was approved by the Director of the New Mexico Oil Conservation Division (OCD). The plan was subsequently renewed on April 24, 1991. This discharge plan was required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and was approved for a period of five years. The approval will expire on January 16, 1996.

On March 21, 1995 you were notified of the upcoming expiration. In order to continue operations at the facility, the discharge plan must be renewed prior to expiration.

If your facility continues to have potential or actual effluent or leachate discharges and you wish to continue operation, you must renew your discharge plan. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can extend for several months. Please indicate whether you have made, or intend to make, any changes in your system, and if so, please include these modifications in your application for renewal.

Please submit the original and one copy to the OCD Santa Fe Office and one copy to the OCD Hobbs District Office. Note that the completed and signed application form must be submitted

with your discharge plan renewal request.

The discharge plan renewal application for the Buckeye Gas Processing Plant is subject to the WQCC Regulations 3-114 discharge plan fee. Every billable facility submitting a discharge plan renewal will be assessed a fee equal to the filing fee of fifty (50) dollars plus a flat fee of $1667.50 for gas processing plants.

The (50) dollar filing fee is to be submitted with discharge plan renewal application and is nonrefundable. The flat fee for an approved discharge plan renewal may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the discharge plan.

Please make all checks payable to: **NMED-Water Quality Management** and addressed to the OCD Santa Fe Office.

If you no longer have any actual or potential discharges a discharge plan is not needed, please notify this office. If you have any questions regarding this matter, please do not hesitate to contact Mark Ashley at (505) 827-7155.

Sincerely,

Roger C. Anderson

RE: Discharge Plan GW-04 Renewal
Buckeye #2 Gas Processing Plant
Lea, New Mexico

Dear Sir:

On January 16, 1986, the groundwater discharge plan, GW-029, for the Buckeye Gas Processing Plant located in the NE/4 NE/4, Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico, was approved by the Director of the New Mexico Oil Conservation Division (OCD). The plan was subsequently renewed on April 24, 1991. This discharge plan was required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and was approved for a period of five years. The approval will expire on January 16, 1996.

If your facility continues to have potential or actual effluent or leachate discharges and you wish to continue operation, you must renew your discharge plan. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can extend for several months. Please indicate whether you have made, or intend to make, any changes in your system, and if so, please include these modifications in your application for renewal.

To assist you in preparation of your application, I have enclosed an application form and a copy of the OCD's Guidelines for the Preparation of Ground Water Discharge Plans at Natural Gas Plants and a copy of the WQCC regulations. Please submit the original and one copy to the OCD Santa Fe Office and one copy to the OCD Hobbs District Office. Note that the completed and signed application form must be submitted with your discharge plan renewal request.

The discharge plan renewal application for the Buckeye Gas Processing Plant is subject to the WQCC Regulations 3-114 discharge plan fee. Every billable facility submitting a discharge plan renewal will be assessed a fee equal to the filing fee of fifty (50) dollars plus a flat fee of $1667.50 for gas processing plants.

The (50) dollar filing fee is to be submitted with discharge plan renewal application and is nonrefundable. The flat fee for an approved discharge plan renewal may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the discharge plan.

Please make all checks payable to: **NMED-Water Quality Management** and addressed to the OCD Santa Fe Office.

If you no longer have any actual or potential discharges a discharge plan is not needed, please notify this office. If you have any questions regarding this matter, please do not hesitate to contact Mark Ashley at (505) 827-7155.

Sincerely,

Roger C. Anderson

ENV - POLLUTION CONTROL
Water Pollution Control Permits
Buckeye Gas Processing Plant

January 15, 1991

Mr. David G. Boyer
Environmental Bureau Chief
New Mexico Oil Conservation Division
P. O. Box 2088
State Land Office Building
Santa Fe, New Mexico 87504

Dear Mr. Boyer:

Enclosed is Texaco Exploration and Production Inc.'s Buckeye Gas Processing Plant's Groundwater Discharge Plan.

The only significant change at the plant since submission of the last plan has been the elimination of the flare burn pit. Originally the water from the flare knockout drum was discharged to the burn pit. It is now discharged to the oil/water separator discharge line for use as waterflood makeup water.

Additionally, our program for berming, curbing and paving of process areas has been included in the plan.

Please feel free to call me at (918) 560-7055 if you require additional information.

Sincerely,

Ray Russell

GROUNDWATER DISCHARGE PLAN

TEXACO'S NATURAL GAS PLANTS & LIQUIDS DIVISION

BUCKEYE GAS PROCESSING PLANT

LEA COUNTY, NEW MEXICO

January 16, 1991

I. GENERAL INFORMATION

A. Name of Discharger or Legally Responsible Party

Texaco Exploration and Production Inc.'s Buckeye Gas Processing Plant
West Star Route, Box 425
Lovington, NM 88260
phone: (505) 396-4916

B. Name of Local Representative or Contact Person

Plant Superintendent: C. D. Trammell
(Same as Above)

Environmental Coordinator: C. R. Russell
Texaco Exploration and Production Inc.
P. O. Box 1650
Tulsa, OK 74102
(918) 560-7055

C. Location of Discharge

SE/4, SE/4 and SW/4, SE/4 Section 36, Township 17 South, Range 34 East and NE/4, NE/4 and SW/4, NE/4, Section 1, Township 18 South, Range 34 East, Lea County, NM.

A topographic map and a facility plot plan are included in Appendix 4.

D. Type of Natural Gas Operation

The plant is a cryogenic natural gas processing plant designed to process 22.5 million cubic feet per day. At present the plant is processing approximately 5-6 million cubic feet per day and producing about 1300 barrels of demethanized product (ethane, propane, butanes, pentanes and heavier).

E. Affirmation

"I hereby certify that I am familiar with the information contained in and submitted with this application and that such information is true, accurate and complete to the best of my knowledge and belief."

Signature: Ray Russell Date: 11/15/90

Printed Name: RAY Russell Title: Environmental Coordinator

II. PLANT PROCESSES

A. Sources and Quantities of Effluent and Process Fluids

1. Scrubbers and Separators: The plant utilizes inlet and discharge scrubbers on each compressor and one high pressure separator between compression and cryogenic processing. The scrubber water may typically be high in Total Dissolved Solids (TDS) and may contain dissolved hydrocarbons. (The laboratory analysis for the high pressure separator water is included in the attached Appendix 2.)

   The combined flow from the inlet scrubbers, discharge scrubbers and the high pressure separator is approximately 633 gallons per day.

   There are no known additives in the scrubber water or the high pressure separation water.

2. Boilers: The Buckeye Gas Processing Plant does not utilize boilers in its operations.

3. Engine Cooling Water: Each engine has its own closed cooling water system. The water contains an ethylene glycol based antifreeze and Calgon LCS-20 corrosion inhibitor. The Material Safety Data Sheet (MSDS) for LCS-20 is enclosed as part of Appendix 1. The engine coolant is not routinely discharged but should a mechanical failure such as a cracked engine head or ruptured hose occur, the coolant would be discharged to the oil/water separator.

4. Cooling Tower: The cooling tower water is continuously discharged to the oil/water separator discharge line through a 1" buried line. The discharge rate range will vary from 10,000 gallons per day to 16,500 gallons per day. The discharge water can be expected to contain high TDS. The water may contain any of the following additives:

   Calgon pHree Guard 2205 corrosion inhibitor
   Calgon CL-361 deposit control
   Calgon H-510 biocide
   Calgon H-450 biocide
   Calcium Hypochlorite for algae control
   Sulfuric acid for pH control

   The MSDS's are enclosed as part of Appendix 1.

5. Sewage: The sewage system at the Buckeye Gas Processing Plant consists of a septic tank and lateral lines. This system is completely separate from and independent of all other plant waste systems.

6. Others:

   a. Used engine oil: Used engine oil is drained to a sump and then through the process sewer lines to the oil/water separator where it is reclaimed, along with other slop oils, and pumped to storage. The oil is then sold to Texaco Trading and Transportation Inc. for reintroduction into crude oil supply. The only engine oil additive used by the plant is Champion Products, Inc.'s Qx with Moly. The MSDS is enclosed as a part of Appendix 1.

   b. Equipment Cleaning Solution: The plant uses a mixture of water and Crain Chemical Company's RL-1260 Industrial Cleaner for engine and equipment cleaning. The MSDS is enclosed as a part of Attachment 1. The combined used engine oil and equipment cleaning solution discharged is approximately 20 gallons per day.

   c. Water Softener Wastewater: The water softener wastewater can be expected to be high in TDS and sodium chloride as a result of the regeneration process. The average discharge to the oil/water separator is 167 gallons per day.

B. Quality Characteristics

All plant wastewaters, except cooling tower blowdown, high pressure scrubber water and a small amount (5 gal/day) of water from the flare knockout drum, are commingled at the oil/water separator. (See the Wastewater Block Flow Diagram included in Appendix 3.) All wastewater transfer, storage and collection units are constructed of either reinforced concrete or steel piping therefore minimizing any risk of ground water contamination. (See Item #II-C for additional details.)

Because of the low risk of groundwater contamination we have elected to treat all sources discharged into the oil/water separator as a commingled source.

In addition to the oil/water separator; the high pressure separator, the cooling tower blowdown and the plants fresh water well were sampled for analyses.

1. TDS, pH, Cations/Anions: See the laboratory analyses included in Appendix 2.

2. Benzene, Ethylbenzene, Toluene, Meta-Ortho-Para Xylenes: See the laboratory analyses included in Appendix 2.

3. WQCC Section 3-103 Parameters: See the laboratory analyses included in Appendix 2.

4. WQCC 1-101.uu: Since this facility does not manufacture chemical compounds (including herbicides, pesticides and chlorinated hydrocarbons) we would expect to find only those hydrocarbon compounds that are naturally occurring such as benzene, toluene and xylene. Benzene, toluene and xylene which have been quantified under item #2, above.

5. Sampling Locations, Methods and Procedures: The sampling locations include the following:

   Freshwater well - ¼" valve at the wellhead.

   High pressure separator - ¼" valve on the water discharge line.

   Cooling tower - ¼" valve on the circulation pump.

   Oil/water separator - 1" valve on the pump discharge line.

   All samples were unfiltered grab samples that were preserved and analyzed in accordance with EPA SW 846 and/or Standard Methods for the Examination of Water and Wastewater (17^{th} edition). The samples were then transported, on ice, to Southwestern Laboratories, Inc. in Midland, Texas for analyses.

6. Variability in Flow Rates and Concentration: During normal operations we anticipate no significant fluctuations in flow rate or concentration in the plant effluents. However, if there is a mechanical malfunction at off-site gas gathering locations there is a possibility of increased volumes of produced water and oil flowing to the plant. We would not anticipate an increase in concentration.

C. Transfer and Storage of Process Fluids and Effluents

1. Water and Wastewater Flow Schematics: See Wastewater Block Flow Diagram in Appendix 3.

2&3. Description of Equipment Associated with Wastewater Production and Handling

a. Inlet Scrubber #1 - The inlet scrubber is a pressurized vessel which discharges automatically into the drain system. The dump line is connected to the drain lines with a solid connection. The dump line is constructed of 2" schedule 80 carbon steel pipe (.218 wall thickness) and goes into a 4" schedule 40 carbon steel drain pipe (.237 wall thickness). The drain lines and a portion of these dump lines are buried. The fluids drain into the oil/water separation pit which will be discussed later. All drain lines are 25 years old.

b. Inlet Scrubber #2 - The inlet scrubber is a pressurized vessel which discharges automatically into the slop oil tanks. The discharge line is constructed of schedule 80 carbon steel pipe and has a solid connection to a 4" schedule 40 carbon steel pipe which is connected to the slop oil tank. The vessel also has an emergency discharge line which is constructed of 2" schedule 80 carbon steel pipe which is reduced to a 1" carbon steel line. This line is normally closed and is opened only in an emergency.

c. Dehydration Beds Horizontal Scrubber - The horizontal scrubber on the dehydration beds is a pressurized vessel which discharges condensed water through a 1" carbon steel line to a vessel known as the Flash Tank. All except 7' of line is buried.

d. 1st Stage Discharge Scrubber on #6 Engine - The discharge scrubber is a vessel which separates gas and liquid by gravity. It is a pressurized vessel which discharges liquid to the flash tank through a 1" carbon steel line. All but 4' of this line is buried.

e. Slop Oil Tanks - The slop oil tanks are standard welded tanks with side thickness of 3/16" and bottom thickness of ¼". The east tank has a capacity of 250 barrels and is 15' tall. The west tank has a capacity of 250 barrels and is 8' tall. The east tank receives fluid from the flash tank, the #2 inlet scrubber, the oil/water separation pit, and, at times, the #1 inlet scrubber. The water and oil are further separated and the water is drained back to the oil/water separation pit through a 2" schedule 80 carbon steel pipe which eventually is connected to the 4" drain line. The oil is pumped to the west tank which holds only sellable oil. The water which may collect in the west tank is drained back to the oil/water separator via the same drain line as the east tank.

f. Glycol Reconcentrator - The water from the glycol reconcentrator is condensed steam. The water drains by gravity into a small holding pot which is connected to the 4" drain system by a 1" carbon steel line. This is not a pressurized vessel and the drain line is buried.

g. Water Softener Wash Water - The discharge from the water softener regeneration cycle is piped into a floor drain which is inside the softener building. The piping consist of 1" schedule 40 PVC. The piping from the floor drain then attaches to the 4" drain system with a solid connection.

h. 1st Stage Discharge Scrubbers From Other Compressor Engines - All compressor engines, with the exception of #6, have a scrubber on the 1st discharge. These scrubbers separate gas from liquid by means of gravity. The vessels are all pressurized and are discharged automatically. They all discharge into 1" carbon steel lines which are then connected to the 4" drain system. These lines are buried with the exception of about 2' on each engine.

i. 1st Stage Discharge Filter - The filter is a pressurized vessel which automatically discharges liquid to the drain via a 1" carbon steel line. The line is attached to the 4" drain system by means of a solid connection. The 1" line is buried with the exception of approximately 8'.

j. 2nd Stage Suction Scrubbers - The 2nd stage scrubbers are pressurized vessels which discharge liquid automatically. They separate liquid and gas by means of gravity. The scrubbers are connected by a 1" carbon steel line and dump into the drain system via an above ground open drain. All of these lines are buried except approximately 7' on each engine and 1' where the line feeds into the open drain. The open drain is approximately 8" above ground level.

k. 2nd Stage Discharge Scrubber - The 2nd stage discharge scrubber is a pressurized vessel which discharges liquid automatically into the 4" drain system. The discharge line is constructed of 1" carbon steel pipe with all but approximately 5' buried. The attachment of the 1" line to the 4" line is solid.

l. Engine Room Sump - The sump in the engine room is constructed of reinforced concrete and is an integral part of the concrete slab. Any oil and water which drains off the engines and compressors collects in this sump. The drains are connected with 4" schedule 40 carbon steel pipe. This 4"

drain then connects with the 4" drain system. The connection is solid. All water and soap used for cleaning purposes also drains into these sumps.

m. Engine Blowdown Scrubber - The engine blowdown scrubber is a vessel which drains liquid from the engine blowdown line to the oil/water separation pit. The liquid is carried in a 2" schedule 80 carbon steel pipe all of which is buried with the exception of 6".

n. 500 Bbl Emergency Waste Water Storage Tank - There is a 4" schedule 40 carbon steel pipe used to pump water from the oil/water separation pit to the 500 bbl tank located just east of the plant fence. This line is buried except 2'. There is approximately 10' of 2" schedule 80 carbon steel pipe used to connect the tank to the 4" line. The tank is a standard 500 bbl bolted tank. The thickness of the walls and bottom are unknown.

o. Oil/Water Separator - The oil/water separator basin is constructed of reinforced concrete which has overall dimensions of 10' x 6' x 5.5'. Any produced water which comes into the plant is routed to the separator for separation. All liquids from the above sources gravitate to the basin through the drain system. The water is pumped through a 2" schedule 80 carbon steel pipe to Texaco Producing Incorporated's water storage tank to await disposal. The tank is a 500 bbl tank located at the L, M, N and O tank battery located approximately ½ mile northwest of the plant. The top edge of the separator pit is approximately 10" above grade so there is no rainfall runoff entering the pit. The separator capacity is approximately 2500 gallons.

p. High Pressure Separator - The high pressure separator is a pressurized vessel which dumps water automatically. The water flows through a 1" carbon steel line and then into a 2" schedule 80 carbon steel pipe which attaches to the line to Texaco Producing Incorporated's water storage tank. The line is buried except for 30'.

q. Cooling Tower Blowdown - The cooling tower blowdown originates at the discharge of the cooling water circulation pumps. The water is discharged into a 1" carbon steel pipe which is buried except for 15'. The line is connected to the 2" oil/water separator discharge line.

r. Flare Water Knock-out - Condensed water from the flare gravitates into a horizontal steel vessel which is below ground level. The pit has earthen dikes around it to prevent rainfall from entering. The water is pumped automatically through a 1" carbon steel pipe to the oil/water separator discharge line.

D. Spill/Leak Prevention and Housekeeping Procedures

1. Containment and Cleanup of Spills: Texaco's Buckeye Gas Processing Plant is manned 24 hours per day, 7 days per week. During non-business hours and on weekends the plant is manned by one of several Operators. The plant is visually inspected on an hourly basis by the Operator.

In the event of a spill that cannot be handled with personnel and equipment on site, the Plant Superintendent or his designated representative will call a trained and experienced local contractor who can provide the equipment necessary to contain and remove the spill. The contractor's equipment may include, but is not limited to, vacuum trucks, dump trucks, backhoes, hand tools and absorbent material.

The Buckeye Gas Processing Plant has in effect a plan for prevention of significant spills that could lead to groundwater contamination. This plan calls for the installation of curbing, diking and/or other acceptable containment measures around all ground level storage vessels. The plant has made a commitment to have this work completed within two years of this date.

This plan also provides that any future ground level storage tanks will be installed on curbed pads constructed of concrete or other impervious material that will facilitate the detection of leaks.

Any spill contaminated materials will be disposed of in a manner that is consistent with all applicable local, state and federal regulations.

In the event of a reportable spill, leak or release notification will be provided in accordance with New Mexico Oil Conservation Division Rule 116 and any other applicable rules or regulations.

2. Housekeeping Procedures: Empty chemical drums are rinsed until clean and then stored for return to the providing vendor. The rinsate is returned to process. Where practical the plant utilizes bulk storage tanks in lieu of drums.

Oily rags are accumulated in drums placed at strategic locations throughout the plant. The oily rags are then returned to the vendor for cleaning and reuse.

Trash is stored in a dumpster as it is generated. Waste Management of Southeast New Mexico removes the trash for disposal at the City of Hobbs Landfill.

The plant has a spill program in effect that calls for the installation of drip/leak collection pads or vats around or under all sources that have a history of leaking or have a high potential to leak. The sources that will be controlled will include certain pumps, valves, flanges, chemical pots, and blowdown lines.

The plant has already installed drip vats under the chemical drum racks. The vats are emptied on an as-needed basis by use of a portable pump. The material removed from the vats is returned to process.

Should a spill or leak occur any contaminated soil is removed and disposed of in accordance with applicable local, state and federal regulations.

The plant's spill program is scheduled to be completed within two years from this date.

3. Leak Detection: The plant operators conduct hourly walk-through inspections of the entire facility. If a leak is discovered the plant operator will initiate corrective action. In the event of a serious or catastrophic leak the plant operator may initiate emergency procedures as outlines in Item II.D.1.

   Any problems encountered are noted in the operators log book.

   Additionally, the plant plans to leak test all buried wastewater lines within 2 years from this date. All pressurized lines will be hydrostatically tested at 1.5 times their operating pressure. Open-end lines will be tested by pneumatic or other acceptable non-destructive testing techniques. Records of the leak testing will be maintained in the plant files.

4. Injection Wells: See Item III.A.2.

III. EFFLUENT DISPOSAL

A. Existing Operations

1. On-site Facilities: Texaco's Buckeye Gas Processing Plant does not utilize on-site disposal facilities.

2. Off-site Facilities

   a. Sludges and Solids - The plant disposes of sludges and solids on an as-needed basis. When disposal is required the transporter and disposal site utilized will meet all local, state and federal requirements.

   b. Wastewater - All of the plant's wastewaters are disposed of in Texaco Exploration and Production Inc.'s (TEPI) Vacuum Greyburg San Andres Unit Water Flood System. The wastewater is pumped from the plant through a 2" carbon steel line to a 500 bbl produced water storage tank that is owned by TPI. TPI then draws water from the storage tank for use in any of several Class II injection wells located in Sections 1 and 2, Township 18 South, Range 34 East and in Section 35, Township 17 South, Range 34 East.

   The injection wells and the water flood project are operated by:

   Texaco Exploration and Production Inc.
   West Star Route
   Box 425
   Lovington, NM 88260

B. Proposed Modifications: Not applicable.

IV. SITE CHARACTERISTICS

A. Hydrological Features

1. There are no known bodies of water, streams or other watercourses within one mile of the Buckeye Gas Processing Plant.

There are ten known freshwater wells within a one mile radius of the plant:

- Texaco Exploration and Production Inc. VGSA Unit D Well #3
  Section 1, Township 18 South, Range 34 East

- Texaco Exploration and Production Inc. VGSA Well #2
  Section 2, Township 18 South, Range 34 East

- Texaco Exploration and Production Inc. field office
  Section 1, Township 18 South, Range 34 East

- Texaco Exploration and Production Inc. CVU Extraction Well #2
  Legal description not known

- Texaco Exploration and Production Inc. CVU Extraction Well #1
  Section 1, Township 18 South, Range 34 East

- Texaco Exploration and Production Inc. CVU WSW #2
  Section 6, Township 18 South, Range 35 East

- Texaco Exploration and Production Inc. CVU #3
  Section 6, Township 18 South, Range 35 East

- Texaco Exploration and Production Inc. Buckeye Gas Processing Plant
  Section 36, Township 17 South, Range 34 East

- New Mexico Potash Corporation Well #8
  Section 31, Township 17 South, Range 34 East

- New Mexico Potash Corporation
  Section 31, Township 17 South, Range 35 East

Two of the wells, Texaco Exploration and Production Inc.'s CVU Extraction Wells #1 and #2, are used for a groundwater remediation project. The Texaco Exploration and Production Inc. field office well is used for drinking water. All other wells are used for industrial purposes.

2. The depth to the first usable aquifer, the Ogallala aquifer, averages 115-120 feet. On January 3, 1991 the plant's water well was sampled for water quality analyses. The results indicated 402 mg/l TDS. The analyses are included in Appendix 2.

3. During a 1989/1990 groundwater contaminations study, conducted by the New Mexico Oil Conservation Division and Texaco Exploration and Production Inc., the groundwater flow direction was determined to be from the northwest to the southeast. A groundwater flow contour drawing has been included as Appendix 5.

B. Geological Description of Discharge Site

A geological description of the discharge site can best be described by including an excerpt from:

Groundwater Contamination Study
Texaco CVU WSW #3
Vacuum Field, Buckeye
Lea County, New Mexico

by Eddie W. Seay
New Mexico Oil Conservation Division
Hobbs, New Mexico
1989-1990

Site Geology

Geographically, the site is situated near the western boundary of the southern extension of the High Plains in Southeastern New Mexico. Topographically, the Southern High Plains, a plateau, rises approximately 100 to 300 feet above the surrounding region and slopes to the Southwest at 10 to 20 feet per mile.

The formation of interest in this area was the DacCum group, or "Redbed" and the Ogallala. The relatively impermeable shale facies of the upper portion of the Triassic Redbed represent the lower limit of the overlying Ogallala aquifer.

The Triassic Redbeds are composed of red to reddish brown mudstone with minor interbedded sandstone. This clay formation which underlies the fresh water aquifer is very irregular, varying in depth as much as fifty feet. Where the redbeds are exposed to the surface, it appears the changes and irregularities are due to stream erosion. These ridges and channels along with the southeastward dip of the redbed surface control the direction and movement of ground water in the lower portion of the "Ogallala" formation.

The Ogallala formation overlying the redbeds was found to consist of an upper unit of very dense light gray, beige to light pink caliche that contained occasional thin layers of light to medium brown very fine-grained silty sand. This upper caliche unit ranged in thickness from 28 to 80 feet. Underlying the upper caliche unit, the Ogallala formation consisted of unconsolidated, loose to very loose very fine-grained clean to silty sand with some medium to coarse-grained, clean to silty sand containing occasional small diameter gravel with occasional thin layers of very fine to medium grained sandstone and sandy clay. Immediately below the middle unit and just above the base of the Ogallala formation a 2 to 12 foot section of clean 1/8 to 1/2 inch diameter gravel was encountered.

The Ogallala aquifer commonly yields 250 to 800 gallons per minute (gpm) and locally yields as much as 1000 gpm in some wells.

The quality of the ground water in the Ogallala formation is reported to be generally suitable for domestic, municipal and irrigation use. Water in this area is also used for makeup waterflood projects.

C. Flood Protection

After an exhaustive search of governmental agencies, specific flooding information could not be located. However, during the 25 year operating history of the plant there have been no known flooding events.

The annual rainfall totals from the nearest recording station in Lovington, New Mexico are:

1978	16.4 inches
1979	10.7 "
1980	13.8 "
1981	27.8 "
1982	13.2 "
1983	10.3 "
1984	27.7 "
1985	23.05 "
1986	16.45 "

April 18, 1991

Mr. Roger C. Anderson
New Mexico Energy, Minerals & Natural Resources Department
Oil Conservation Division
P.O. Box 2008
State Land Office Building
Santa Fe, NM 87504

Dear Mr. Anderson:

Pursuant to your February 22, 1991 letter, Texaco offers the following commitments in order to correct any deficiencies that were found during your plant visit. Our responses are in the order in which they were presented in your February 22, 1991 letter.

1. a) The drum storage north of the generator building will have a concrete pad 8' X 4' with a 4" containment curb.

   b) The kerosene saddle tank will have a concrete pad 8' X 4' with a 4" containment curb to contain spills and leakage.

   c) The phosphate tank west of the cooling tower will have a concrete pad 8' X 5' poured to contain any leaks or spills. The pad will have a 4" containment curbing.

   d) The biocide drums north of the cooling tower will be placed on a concrete pad 4' X 8' with a 4" containment curb.

   e) The present berm around the glycol tank will be enlarged to include the glycol saddle tanks.

   f) A concrete pad with a 4" containment curb will be built along the north fence for drum storage.

   g) The oil/water drip line on the air compressors will be routed so it will be dumping to the drain in the engine room.

2. The product shipping pump will have an angle iron curb installed with a neoprene gasket to prevent oil from leaking off the pad. This work will be completed by October 1, 1991.

3. The existing berming at the slop oil tanks will be enlarged to a capacity of 1-1/3 the volume of both tanks. This work will be completed by June 1, 1991.

4. The main waste sump will be completely emptied and the walls and bottom washed down with fresh water and visually inspected for cracks. This will be completed by July 9, 1991 and then reinspected annually.

5. The glycol pumps will be surrounded by a concrete pad with a 4" containment wall which should contain all leaks and spills. A sump pump will be placed at one corner of this pad. Pumps are visually checked a minimum of four (4) times in an eight (8) hour shift. This work will be completed by December 31, 1991.

6. a) The DGA tank will be bermed with concrete and will hold 1-1/3 the volume of the tank. Engineering is being consulted for assistance in material specification, sizing, etc. This work should be completed by December 31, 1991.

   b) The lube oil tank will be bermed with concrete and will hold 1-1/3 the volume of the tank. This work will be completed by December 31, 1991. Engineering is being consulted for assistance in material specification, sizing, etc.

7. A concrete containment wall will be built on the cooler pads of the recompressors with a drain running back to the drains in the engine room. This should contain all oil leaks on the pads. The work should be completed by April 1992.

Please call me at (918) 560-7055 if you have any questions or require additional information.

Sincerely,

Ray Russell

OIL CONSER[illegible]N DIVISION
RECEIVED
[illegible] AM 10 26

March 14, 1991

Mr. William J. Lemay, Director
New Mexico Energy, Minerals and
Natural Resources Department
Oil Conservation Division
P.O. Box 2088
Santa Fe, New Mexico 87504-2008

Dear Mr. Lemay:

This responds to Roger Anderson's letter dated March 1, 1991, concerning the renewal or modifications of the following discharge plans:

(GW-3) - Texaco USA, Eunice #1 Gas Plant located in Section 27, Township 22 South, Range 37 East, NMPM, Lea County, New Mexico.

(GW-53) - Enron Gas Pipeline Operating Company, Yates Processing Plant located in Section 25, Township 18 South, Range 25 East, NMPM, Eddy County, New Mexico.

Mr. Anderson provided us copies of the New Mexico Water Quality Control Commission Regulations as amended through November 25, 1988, and the Rules and Regulations of the State of New Mexico Energy, Minerals and Natural Resources Department, Oil Conservation Division (Division) dated October 16, 1989. He also included copies of the following documents.

1. The amended rules for the abandonment and plugging of wells.

2. The application for exception to Division Order R-8952 for protection of migratory birds for the Eunice #1 Gas Plant Pit #3, signed by Ray Russell, Environmental Coordinator for the operator, Texaco Producing Inc.

3. A copy of the modification permit request for the land farm application of nonhazardous contaminated soil from Enron Gas Plants (GW-53).

The information provided for GW-53 adequately addresses the U.S. Fish and Wildlife Service (Service) concerns relative to the land farm procedures.

The Service, however, finds the information contained in the application for exception to Division Order R-8952 for GW-3 to be inaccurate and strongly disagrees with the decision by the Division to grant the exception.

The requirement contained in order R-8952 to screen, net, or cover a pit or tank for the protection of migratory birds does not apply to migratory waterfowl species alone, but to all migratory bird species. Migratory birds that are not waterfowl include, but are not limited to, sparrows, hawks, blackbirds, doves, flycatchers, kingbirds, larks, swallows, thrushes, and wrens, all of which have ranges that include the area of this gas plant. Therefore, the statement that this pit is not within a migratory waterfowl management corridor within the Central Flyway is not sufficient to eliminate the potential use of water impoundments by migratory bird species. Additionally, the Eunice #1 Gas Plant Pit #3 in Lea County, New Mexico, does occur within the Central Flyway. The Central Flyway consists of Alberta, Saskatchewan; Colorado, Kansas, Montana, Nebraska, New Mexico, North Dakota, Oklahoma, South Dakota, Texas, and Wyoming; and Mexico (U.S. Department of the Interior, Fish and Wildlife Service, 1984, Flyways, Pioneering Waterfowl Management in North America).

The facility is manned 24 hours a day, and although the pit is checked two times each day and is located within the fenced boundaries of the facility, this does not lessen the accessibility of the pit to migratory birds. Human activity will not necessarily negate the use of this water impoundment by migratory birds. In addition, the removal of hydrocarbon residue within 4 hours by vacuum truck does not reduce the risk to migratory birds that contact oil and would subsequently be killed.

The Migratory Bird Treaty Act (MBTA) does not allow any exception to the take of migratory birds. If any migratory birds are killed in this pit (or any other) and documented due to granting of an exception to screening at this facility, the Service will turn the case over to the U.S. Attorney for review and possible prosecution under the MBTA. To avoid this eventuality, the Service recommends that <u>all</u> wastewater impoundments be designed and constructed to prevent access by migratory birds,

The screen, fence, net, or cover used should be of sufficient size to prevent access to the pit, tank, or impoundment. The use of unlined pits, tanks, or impoundments should also be avoided as seepage can provide migratory bird access to contaminated water. Failure to implement these measures could subject companies, and even individuals, to civil and/or criminal liabilities under the MBTA, the Endangered Species Act, and the Eagle Protection Act.

If you have any questions concerning our comments, please contact Thomas O'Brien or Joel Lusk at (505) 883-7877 or FTS 474-7877.

Sincerely,

Jennifer Fowler-Propst
Field Supervisor

RETURN RECEIPT NO. P-327-278-087

Ms. Jennifer Fowler-Propst
Field Supervisor
U. S. Fish and Wildlife Service
Suite D
3530 Pan American Highway, N.E.
Albuquerque, New Mexico 87107

Dear Ms. Fowler-Propst:

The Oil Conservation Division (OCD) has received your comments, dated February 11, 1991, concerning the renewals and/or modifications of the following discharge plans:

(GW-53) - Enron Gas Pipeline Operating Company, Yates Processing Plant located in Section 25, Township 18 South, Range 25 East, NMPM, Eddy County, New Mexico.

(GW-29) - Texaco USA, Buckeye Gas Processing Plant located in Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico.

(GW-3) - Texaco USA, Eunice #1 Gas Plant located in Section 27, Township 22 South, Range 37 East, NMPM, Lea County, New Mexico.

(GW-4) - Texaco USA, Eunice #2 Gas Plant located in Section 28, Township 21 South, Range 37 East, NMPM, Lea County, New Mexico.

The permitting of the Class II injection wells at the Texaco facilities (GW-3, GW-4 and GW-29) are not within the scope of the advertised discharge plan renewal applications. However, all Class II injection wells are permitted under the EPA-approved Underground Injection Control (UIC) program pursuant to Rules 701, 702, 703 and 704 of the OCD Rules and Regulations (enclosed). Any other discharges from a facility are regulated and controlled by a permit known as a "Ground Water Discharge Plan" issued pursuant to Part 3 of the New Mexico Water Quality Control Commission Regulations (enclosed). A discharge plan authorizes specific methods for disposal of wastes generated at the facility including disposal at another OCD permitted site.

Although the process water evaporation pond at Texaco's Eunice #1 Gas Plant is not screened or netted it is subject to OCD's Rule 8 (enclosed), and has been approved for exception to Division Order R-8952 requiring protection for migratory birds. A copy of the exception form and Texaco's protective measures are enclosed with this letter. OCD is evaluating whether the existing mitigation efforts are sufficiently effective.

The land farm application is a specific modification requested for a previously approved discharge plan (GW-53). As with new discharge plan applications, modification requests are reviewed very carefully to afford maximum protection to surface water, ground water and the environment. I am enclosing a copy of the modification application. In addition to the requirements committed to in the application, the OCD will not allow any fluids to be introduced to the land farm without prior approval and after complete review of proposed application techniques. This requirement will dramatically reduce the possibility of migration of contaminants by limiting any hydrostatic head available to move contaminants downward into soils or groundwater.

If you have further concerns or comments, please do not hesitate to contact me.

Sincerely,

Roger C. Anderson
Environmental Engineer

RE: Discharge Plan GW-29
Buckeye Gas Processing Plant
Lea County, New Mexico

Dear Mr. Russell:

The Oil Conservation Division (OCD) has received and is in the process of reviewing the above referenced discharge plan renewal application, dated January 15, 1991. The following comments and requests for additional information and commitments are based on review of the application and observations from the February 5, 1991, OCD site inspections:

1. All drum storage, above ground storage and areas susceptible to leaks must have a pad and curbing type containment. The following areas were identified that require containment:

   a) The drum storage north of the generator building.

   b) The kerosene saddle tank.

   c) The phosphate tank west of the cooling tower.

   d) The biocide drums north of the cooling tower.

   e) The glycol saddle tank.

f) Drum storage along the north fence north of the compressor building.

g) The oil drip line on the southwest end of east engine room.

Submit a plan and completion timetable to establish containment of these locations.

2. A product pump was leaking off its concrete pad. The pad had no method to contain spills or leaks. Submit a completion timetable for installing containment on this pad.

3. The two interconnected slop oil tanks were within a berm that would contain the volume of one of the tanks. Submit a completion timetable for increasing the bermed volume to one and one third (1 1/3) the volume of both tanks.

4. The main waste sump is not equipped with leak detection. Submit a procedure and schedule for annual visual inspection of this sump to ensure integrity. If major repair or replacement of this sump is necessary in the future, leak detection will be required in the design.

5. The glycol regeneration pump had no containment for spills and leaks. Submit a completion schedule for installing containment for this pump.

6. The DGA Tank and the lube oil tank each require a berm that can impound 1 1/3 the capacity of the tanks. Submit a completion schedule for installation of these berms.

7. The engine coolers on the south end of the West Cooper Building had oil leaking off their pads. Submit a completion schedule for containing these leaks on the pad.

Submission of the above information will allow review of your application to continue. If you have any questions, please do not hesitate to call me at (505) 827-5884.

Sincerely,

Roger C. Anderson
Environmental Engineer

Cons. #2-22-91-I-075

Mr. William J. Lemay, Director
New Mexico Energy, Minerals and
Natural Resources Department
Oil Conservation Division
P.O. Box 2088
Santa Fe, New Mexico 87504-2008

Dear Mr. Lemay:

This responds to your public notice published on January 25, 1991, in which three injection well permit renewals and one permit modification for landfarm application were described. Our comments refer to the following permits:

(GW-53) - Enron Gas Pipeline Operating Company, Yates Processing Plant located in Section 25, Township 18 South, Range 25 East, NMPM, Eddy County, New Mexico.

(GW-29) - Texaco USA, Buckeye Gas Processing Plant located in Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico.

(GW-3) - Texaco USA, Eunice #1 Gas Plant located in Section 27, Township 22 South, Range 37 East, NMPM, Lea County, New Mexico.

(GW-4) - Texaco USA, Eunice #2 Gas Plant located in Section 28, Township 21 South, Range 37 East, NMPM, Lea County, New Mexico.

Wetlands, riparian vegetation, and other sensitive wildlife habitat on or near the sites should be protected. Our concern with injection wells (GW-29, 3, and 4) is the potential impact to fish and wildlife through leakage and other discharges. We recommend that the evaporation pond utilized for GW-3 be covered or screened to prevent migratory bird use. If impacts cannot be avoided, a mitigation plan should be developed to compensate for fish, wildlife and habitat losses.

The landfarm application technique for remediating hydrocarbon contaminated wastes (GW-53) should specifically address the migration of contaminants into the Rio Penasco. We recommend that an alternative technique that is physically contained and involves less land area also be considered. Land application can lead to degradation of the soil through compaction and has limited use. Reusable remediation technology such as contained, rock-filtered

systems, infused with hydrocarbon metabolizing bacteria and fungi, can treat hydrocarbon contaminated soil and wastewater without the potential aquifer contamination associated with well injection, or potential soil degradation associated with landfarm application.

If you have any questions concerning our comments, please contact Thomas O'Brien or Joel Lusk at (505) 883-7877 or FTS 474-7877.

Sincerely,

Jennifer Fowler-Propst

Box 2088, Santa Fe, New Mexico 87504-2088, Telephone (505) 827-S800:

(GW-53) - Enron Gas Pipeline Operating Company, Larry Campbell Compliance Environmentalist, P. 0. Box 2018, Roswell, New Mexico 88201, has submitted a discharge plan modification application for the previously approved discharge plan for its Yates Plant located in the SW/4 Section 25, Township 18 South, Range 25 East, NMPM, Eddy County, New Mexico. The modification request consists of the addition of a controlled bio-remediation landfarm area in the southeast portion of the Yates plant property. Wastes proposed to be remediated at the landfarm are nonhazardous hydrocarbon contaminated soils from field operation mainline gas processing plants. The application addresses procedures to remediate contamination and prevention of possible offsite migration of contaminants. The uppermost ground water is at a depth of approximately 120 feet with a total dissolved solids concentration of approximateky 850 mg/l.

(CW-29) - Texaco USA, John H. Anderson, Operations Manager, P. Q. Box 1650, Tulsa, Oklahoma 74102, has submitted an application for renewal of its previously approved discharge plan for its Buckeye Gas Processing Plant located in NE/4 NE14, Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico. Approximately 6000 gallons per day of process wastewater with a total dissolved solids concentration of approximately 1300 mg/l is disposed of at an OCD permitted offsite Class II disposal well. The uppermost groundwater at the plant site is at a depth of approximately 85 feet with a total dissolved solids concentration of approximately 520 mg/l. The discharge plan addresses how spills, leaks and other accidental discharges to the surface will be managed.

(GW-3) - Texaco USA, John H. Anderson, Operations Manager, P. 0. Box 1650 Tulsa, Oklahoma 74102, has submitted an application for renewal of its previously approved discharge plan for its Eumce #l Gas Plant located in NW/4 SW/4 Section 27, Township 22 South, Range 37 East, NMPA, Lea County, New Mexico. Approximately 70,000 gallons per day of process wastewater with a total dissolved solids concentration of approximately 7000 mg/l is discharged to a lined pond prior to final disposal in an OCD permitted Class II disposal well. The uppermost groundwater at the plant site is at a depth of approximately 65 feet with a total dissolved solids concentration of approximately 1900 mg/l. The discharge plan addresses how spills, leaks and other accidental discharges to the surface will be managed.

(GW-4) - Texaco USA, John H. Anderson, Operations Manager, P. 0. Box 1650, Tulsa, Oklahoma 74102, has submitted an application for renewal of its previously approved discharge plan for its Eunice #2 Gas Plant located in NE/4 SE/4, Section 28, Township 21 South, Range 37 East, NMPM, Lea County, New Mexico. Approximately 17,000 gallons per day of process wastewater with a total dissolved solids concentration of approximately 7100 mg/l is disposed of at an OCD permitted offsite Class II disposal well. The uppermost groundwater at the plant site is at a depth of approximately 70 feet with a total dissolved solids concentration of approximately 1200 to 2600 mg/l. The discharge plan addresses how spills, leaks and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and public hearing may be requested by any interested person. Requests for public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest. If no public hearing is held, the Director will approve or disapprove the proposed plan based on information available. If a public hearing is held, the Director will approve or disapprove the proposed plan based on information in the plan and information submitted at the hearing.

RE: Discharge Plan GW-29
Buckeye Gas Processing Plant
Lea County, New Mexico

Dear Mr. Anderson:

On January 16, 1986, the renewal of ground water discharge plan, GW-29 for the Texaco Buckeye Gas Processing Plant located in the NE/4 NE/4, Section 18, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico, was approved by the Director of the Oil Conservation Division (OCD). This discharge plan renewal was required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and was approved for a period of five years. The approval will expire on January 16, 1991.

If your facility continues to have effluent or leachate discharges and you wish to continue discharging, please submit your application for renewal of plan approval as quickly as possible. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can often extend for several months. Please indicate whether you have made, or intend to make, any changes in your discharge system, and if so, include an application for plan amendment with your application for renewal. To assist you in preparation of your renewal application, I have enclosed a copy of the OCD's guidelines for preparation of ground water discharge plans at natural gas processing plants. These guidelines are presently being revised to include berming of tanks, curbing and paving of process areas susceptible to leaks or spills and the disposition of any solid wastes. Please include these items in your renewal application.

If you no longer have such discharges and discharge plan renewal is not needed, please notify this office.

Please note that all gas plants, refineries and compressor stations in excess of 25 years of age will be required to submit plans for, or the results of, an underground drainline testing program as a requirement for discharge plan renewal.

If you have any questions, please do not hesitate to contact Roger Anderson at (505) 827-5884.

Sincerely,

David G. Boyer, Hydrogeologist
Environmental Bureau Chief

Re: Discharge Plan (GW-29) for
Buckeye Gas Processing Plant,
Lea County, New Mexico

Dear Mr. Anderson:

The ground water discharge (GW-29) for the Texaco Buckeye Gas Processing Plant located in the NE/4 of the NE/4 of Section 1, Township 18 South, Range 34 East, Lea County, New Mexico, is hereby approved. The approved discharge plan consists of the plan dated June 25, 1985, and the materials dated October 8, 1985, November 5, 1985, November 12, 1985, December 10, 1985, and January 13, 1986, submitted as supplements to the discharge plan.

The discharge plan was submitted pursuant to Section 3-106 of the NM Water Quality Control Commission Regulations. It is approved pursuant to Section 3-109.F., which provides for possible future amendment of the plan. Please be advised that the approval of this plan does not relieve you of liability should your operation result in actual pollution of surface or ground waters which may be actionable under other laws and/or regulations.

There will be no routine monitoring or reporting requirements.

Please note that Section 3-104 of the regulations requires that "When a plan has been approved, discharges must be consistent with the terms and conditions of the plan." Pursuant to Section 3-107.C. you are required to notify the director of any facility expansion, production increase, or process modification that would result in any significant modification in the discharge of water contaminants.

Pursuant to Subsection 3-109.G.4, this plan approval is for a period of five years. This approval will expire January 15, 1991, and you should submit an application for new approval in ample time before that date. You are notified now that testing of all underground pipes will be required before renewal of the discharge plan can be considered.

On behalf of the staff of the Oil Conservation Division, I wish to thank you (and your staff and/or consultants) for your cooperation during this discharge plan review.

Sincerely,

R. L. STAMETS
Director

Attention: Jamie Bailey

Re: Texaco Inc.
Buckeye Gas Plant
Discharge Plan

Dear Ms. Bailey:

This letter is to confirm our telephone conversation January 13, 1986. As we discussed, repairs were initiated on the cooling tower at Buckeye G. P. as soon as could be arranged following your's and Mr. Boyer's visit November 22, 1985, in effort to comply with our discussions on methods to eliminate all cooling tower water from reaching the ground. The repairs were 90 to 95% effective toward our goal. However, during windy conditions some overspray of cooling tower water continues to reach ground level. These small amounts will be captured by a drainage system, accumulated in a buried fiberglass tank, then returned to the cooling tower. This should eliminate all ground water caused by the cooling tower overspray.

If I can be of further service in this matter, please call.

Sincerely Yours,
Texaco Producing, Inc.

RE: Discharge Plan - Texaco
Buckeye Gas Processing Plant

Dear Mr. Stamets:

In response to a recent inspection at the above referenced plant by Ms. Jamie Bailey and Mr. David Boyer of your office, and a follow-up telephone request by Ms. Bailey that we confirm, in writing, the following:

1. Installation of a spare pump on the skimmer basin and,

2. Installation of a by-pass line from the discharge of the skimmer basin pumps to a 500bbl. temporary storage tank and,

3. Repair of cooling tower to prevent spray accumulations on the ground.

Items Numbers 1 and 2 have been completed. We have gone out for bids on the cooling tower repair work and expect completion of Item Number 3 by January 1986.

In addition, we would like to certify that in the unlikely occurrence of a catastrophic event that would dictate the use of the burn pit for material other than its intended use, we will immediately notify both the Hobbs and Santa Fe Oil Conservation Division Offices.

Should you have questions or need additional information, please do not hesitate to contact us.

Very truly yours,

John H. Anderson

Santa Fe, New Mexico 87504-2088

Dear Mr. Stamets:

We have reviewed the proposed discharge plan for GW-29, Texaco USA, Buckeye Gas Processing Plant, Lea County, New Mexico. The proposed discharge plan would eliminate an occasional discharge to an existing unlined flare pit. This change will remove a potential source of oil waste discharge exposure to migratory birds. We therefore encourage this change and have no objection to the discharge plan.

These comments represent the views of the Fish and Wildlife Service. Thank you for the opportunity to comment on the proposed plan. If you have any questions concerning our comments please contact Tom O'Brien at (505) 766-3966 or FTS 474-3966.

Sincerely yours,

John C. Peterson

NOTICE OF PUBLICATION
STATE OF NEW MEXICO
ENERGY & MINERALS DEPT
OIL CONSERVATION DIVISION
SANTA FE, NEW MEXICO

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission regulations, the following discharge plan (GW-29) has been submitted for approval to the Director of the Oil Conservation Division, P.O. Box 2088, State Land Office Building, Santa Fe, New Mexico 87504-2088 (505) 827-5800.

Texaco, USA, Buckeye Gas Processing Plant (NE/4, NE/4, Section 1, Township 18 South, Range 34 East, NMPM, Lea County, New Mexico, John Anderson, Authorized Agent; P.O. Box 1650, Tulsa, Oklahoma 74102, proposes to modify its existing facility by eliminating occasional discharges to an existing unlined flare pit from the concrete lined skimmer basin. These discharges, which could occur when the pump which directed effluent to a permitted Class II injection well was out of service, will be eliminated by installation of a second pump. Any emergency discharges will be directed to an above-ground steel tank for temporary storage. Plant liquid wastes are transported to the injection well via [illegible]. The waste water is composed of effluents from the cooling tower and process vessels. The waste water has a total dissolved solids concentration of 1300 mg/l. The ground water most likely to be affected is at a depth of approximately 85 feet with a total dissolved solids concentration of approximately 530 mg/l.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and a public hearing may be requested by an interested person. Requests for public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed plan based on information available. If a public hearing is held, the Director will approve or disapprove the proposed plan based on information in the plan and information submitted at the hearing.

GIVEN Under the Seal of the New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 26th day of November, 1985.

RE: DISCHARGE PLAN: GW-2G
Texaco - Buckeye Gas Processing Plant
Lea County

Dear Mr. Stamets:

In a recent telephone conversation between your Ms. Jami Bailey and L. E. Knight, additional information/clarification was requested. Listed below are our responses to those questions asked.

GENERAL

8. Dike construction around slop oil tankage is complete. There are valves on each end of the site glass on the slop tank.

9. Solid wastes are hauled off site by Waste Control of New Mexico out of Hobbs.

In addition, we wish to correct some information sent to you earlier. Cooling tower blowdown does not enter the skimmer basin, but actually enters the discharge line of the skimmer sump pump which sends the water directly to the water flood operations.

ANALYSES

Analysis of requested sources are included in Attachment No. 1.

We hope this has answered your questions. However, should you need additional information, please feel free to contact me or Lewis Knight at any time.

Very truly yours,

JHA:klb

MEMORANDUM OF MEETING OR CONVERSATION

☑ Telephone ☐ Personal	Time 10AM	Date 10/18/85

Originating Party	Other Parties
Jami Bailey	Louis Knight - Environmental Engineer (918) 560-6331

Subject: Proposed Discharge Plan Texaco - Buckeye Gas Processing Plant Lea County - GW-29

Discussion

1. Requested name of contract hauler + ultimate disposal location of solid waste.
2. Requested info on valves at sight glass at 250 bbl slop oil tank.
3. Requested date for analyses. Effluent analyses should be submitted to us within the week.
4. Re Burn Pit: The figures given in letter dated 10/8/85 were worst case. Really, calculated flow to pit was 0.02 gpm, + of the 2 times he saw the pit, the 1st time it was dry, + the 2nd time it had only small puddles in the bottom. I asked about willingness to line the pit, + he readily suggested using a fiberglass tank, such as they use at all new plants + in Texas.

Conclusions or Agreements

He will check on status of effluent analyses, availability of tank. I will advertise as soon as analyses are submitted.

Distribution: File, D. Boyer

John H Anderson
Manager Tulsa District
Natural Gas Plants Division

Texaco USA

PO Box 3000
Tulsa OK 74102
918 560 6705

October 8, 1985

Mr. R. L. Stamets, Director
Energy Minerals Department
Oil Conservation Division
P. O. Box 2088
Santa Fe, New Mexico 87501

RE: PROPOSED DISCHARGE PLAN
TEXACO-BUCKEYE GAS PROCESSING PLANT
LEA COUNTY, NEW MEXICO GW-2G

Dear Mr. Stamets:

Listed below are our responses to those questions, comments or requests for additional clarifying information in your July 23, 1985 letter regarding the above-referenced proposed Discharge Plan.

1. Topographic map of plant site is enclosed.

2. All available information on plant water well is enclosed.

3. Domestic sanitary waste is not commingled with non-domestic wastes. There is no laboratory at the plant. The septic tank is located East of the office (See enclosed underground line map).

4. Copy of the latest flow sheet enclosed.

5. Copy of the underground piping layout is enclosed. All tanks, except the septic tank are above ground. All underground piping is carbon steel, and is approximately 20 years old.

6. A formal SPCC Plan is not required at this plant. The plant has never had a reportable leak, however, should one occur, we would follow the reporting procedure as outlined in Rule 116.

7. See Attachment No. 1.

8. Dikes around tankage containing oily materials are in place or are being constructed to prevent any flow off plant property. Flow to the process area is prevented due to it being higher than the surrounding plant area.

9. Solid wastes are hauled off site by a contract hauler.

BURN PIT

1. Normal flow to this pit is the condensed water from the flare header. In emergency situations, water from the skimmer basin can be directed to the pit. This would only occur if the skimmer pump was out of service. The volume of water going to the pit is estimated to be less than 0.1 gpm (by calculation).

2. Plot plan shows pit to be 80'x 80'x 6'.

3. Materials are hauled off by Rowland Trucking to Parabo for disposal. Based on calculations, accumulation in pit, counting rainfall, would be approximately 26,280 gallons of water prior to hauling.

4. There is no diversion from the pit. Rainfall is held totally within the pit.

5. See attached topographic map.

6. The only time that any materials can be directed to the burn pit is when the skimmer basin pump is out of service. Past experience indicates that this has happened less than once per year.

CONCRETE SKIMMER BASIN

1. Overall dimensions of the skimmer basin are 10'x 6'x 5.5' (LXWXD).

2. Water from the skimmer is sent to Texaco's waterflood operations at approximately 10 gpm on a continuous basis. Oil from skimmer operations is pumped to the slop oil tank.

3. Any produced water coming into the plant goes to the skimmer for separation. It is then pumped to waterflood operations. The wet regeneration gas from the dehydrators is returned to the compressor second stage suction.

4. Rainfall runoff bypasses the skimmer due to concrete walls about 10" above grade.

5. See attached plot plan.

6. With skimmer overflow valve closed, the skimmer surge volume is about 2,900 gallons. Overflow potential, even during a heavy rain, is nil.

7. Average flow rate to the skimmer is less than 10 gpm.

HYDROLOGY

1. Analyses are forthcoming.

2. Water from skimmer is sent to a waterflood operation. There should be no shut-ins for this type of operation.

We hope this has answered your questions concerning the referenced Discharge Plan. Should you have further questions or require clarification, please feel free to call or write at anytime.

In addition, we request an extension of the 240 day time limit for the issuance of a Discharge Plan as referenced by Ms. Jami Bailey's telephone conversation with me on October 4, 1985.

Very truly yours,

JHA:LEK:lt

MEMORANDUM OF MEETING OR CONVERSATION

☒ Telephone ☐ Personal	Time 9:45	Date 10/4/85

Originating Party	Other Parties
Jami Bailey	John Anderson

Subject: Submittal of Discharge Plan

Discussion

I reminded Mr. Anderson that the 240 day deadline from 1/31/85 - 9/28/85 for approval of D.P. was up + that there had been no response to our letter of 7/23/85. I suggested he immediately ask RLS for extension + submit a schedule of compliance. He will check into it + Louis Knight, Environmental Engineer, will contact us.

10:30 AM Louis Knight (918 560 6331) called, said they had all the info requested in the 7/23 letter except for lab analyses

Conclusions or Agreements

Knight will submit info they have, ask for extension, + give date for submittal of lab analyses

Distribution: File, D Boyer

Signed: Jami Bailey

Re: Proposed Discharge Plan for Texaco - Buckeye Gas Processing Plant, Lea County, New Mexico, GW-29

Dear Mr. Anderson:

The proposed discharge plan dated June 25, 1985, for the referenced facility has been reviewed by me for compliance with the New Mexico Water Quality Control Commission (WQCC) Regulations. I have several questions, comments, or requests for additional clarifying information on the material you submitted.

1) Provide a topographic map of the plant site.

2) Provide a copy of the well log for the plant well.

3) Is domestic sanitary waste commingled with non-domestic type waste (solvents, laboratory chemicals, etc.)? Indicate the location of septic tank(s).

4) Provide a flow chart for the facility operations, particularly describing the cooling tower system.

5) Indicate the location and status of any underground storage tanks and pipes. What is their use, age, and material of construction?

6) Provide a copy of the Spill Prevention Control and Countermeasure Plan (SPCC). How are leaks reported, and to whom? Do you use OCD regulations concerning spills (Rule 116)?

7) What is the location and design of the dikes around the slop oil tanks, cooling tower, and chemical feed tanks?

8) Indicate the location and size of dikes that prevent the flow of oil leaks off the property or toward the process area.

9) What is the disposal method for solid wastes such as spent molecular sieves?

BURN PIT

1) Provide a complete list of all present and past sources and rates of discharge of fluids to the burn pit. How are rates determined?

2) What is the size of the burn pit (L x W x D, Ft.)?

3) What quantity of fluid is accumulated before it is hauled off-site? What is the name of the transporter and the ultimate disposal location? What time periods between haulings?

4) Describe how runoff from heavy rains is diverted from the burn pit.

5) If dikes surround the burn pit, show location and specifications.

6) Under what conditions does the emergency overflow line discharge fluids to the burn pit? How often does that occur?

CONCRETE SKIMMER BASIN

1) Provide design specifications of basin.

2) What quantity of fluid is accumulated before it is sent to the disposal well. What is the length of time between clean-outs? Clarify method of disposition.

3) What is the source and disposal of any produced water and dehydrator fluids? What quantity is produced?

4) Describe how runoff from heavy rains is diverted from the skimmer basin.

5) If dikes surround the skimmer basin, show location and specifications.

6) What is the overflow potential for the skimmer basin?

7) What is the average flow rate of fluids to the skimmer basin?

HYDROLOGY

1) Provide copies of laboratory analyses of samples from burn pit, skimmer basin, engine jacket water cooling tower effluent, and plant well for the following (unless otherwise or previously provided):

TDS	Benzene (all except cooling tower)
Aluminum	
Arsenic	Toluene (all except cooling tower)
Barium	Phenols (water well only)
Boron	
Chromium	Ethylbenzene (all except cooling tower)
Cobalt	(all except cooling tower)
Cyanide	Meta-, Ortho-, and Para- Xylenes
Manganese	
Molybdenum	Copper
Nickel	Iron
Selenium	Chloride
Sulfate	pH
Zinc	

2) Since a disposal well is used for effluent disposal, describe the procedures to be followed to prevent unauthorized discharges to the surface or subsurface in the event the disposal well is shut-in for workover or repairs.

Regarding the unlined burn pit, to be allowed to continue discharging to the unlined pit you must be able to demonstrate that the discharge will not cause ground water standards to be exceeded at a place of present or foreseeable future use of the water. Such a demonstration would need to include a detailed hydrogeological study of the area (e.g., ground water availability and movement, geology, water quality (organic and inorganic parameters), vadose zone interactions, etc.), and your plans for sampling and monitoring both the effluent and ground water

(via likely use of monitoring wells) for the lifetime of the plant and possibly longer (see Section 3-107 of the WQCC Regulations for what may be required). You may wish to investigate an alternate method of disposal, including lining of the burn pit.

If you have any questions on the discharge plan process, feel free to contact Phil Baca or me at (505) 827-5884.

Sincerely,

JAMI BAILEY
Field Representative

Discharge Plan

Dear Mr. Stamets:

We request approval of the enclosed Discharge Plan for Texaco's Buckeye Gas Processing Plant, Lea County.

Should you have any questions, please feel free to contact me or Mr. C. R. Adkison, Area Plant Superintendent at 505/394-2566.

Very truly yours,

J. H. Anderson/was

3. Process Flow Sheet FS-101
4. Process Flow Sheet FS-102

D. The plant is a cryogenic natural gas processing plant designed to process 22.5 million cubic feet per day. At present the plant is processing approximately 7-8 million cubic feet per day and producing about 1,800 barrels per day of demethanized product (ethane, propane, butanes, pentanes and heaviers).

II. Plant Processes - Sources/Quantities/Analyses of Potential Effluents. Please refer to Pages 3, 4 and 5 for information.

III. There are no on-site effluent disposal facilities at the plant. As described in Section II, any effluents produced are oil/water based and are either hauled off-site or sent to a disposal well. The only short term impoundment of an effluent is the burn pit which may from time to time accumulate small quantities of condensed water from the flare. This condensation is then hauled off-site for proper disposal. The burn pit is not lined and is made of natural earthen materials.

IV. There are no known water courses, bodies of water, marshes, swamps, ground water discharge sites, etc. within one mile of our plant other than our own water well. Drinking water samples are sent out for analysis quarterly. We have never failed to pass the state's drinking water quality standard and have no reason to believe the water is contaminated in any way.

V. The plant is operated and manned 24 hours/day, 7 days/week, 52 weeks/year. Operators and supervisors make regular, daily rounds, inspecting the plant. Any leaks or potential leaks are reported and mitigated immediately.

Our plant is well run and maintained by highly qualified and trained employes and because of the inert properties of the materials handled, we can foresee no potential or threat of contamination of any source of water for present or future uses.

"I hereby certify that I am familiar with the information contained in and submitted with this application and that such information is true, accurate and complete to the best of my knowledge and belief."

C. F. Gee
Division Vice President
Natural Gas Plants Division

6-25-85
Date

II. Plant Processes - Sources/Quantities/Analyses of Potential Effluents

Type	Discharge & Destination (GPD)	Treatment	Analyses
1. Engine Jacket Water	None - Closed system	Non-Heavy Metal Corrosion Inhibitor	See attached analysis
2. Cooling Tower	5,760 GPD - Blowdown to concrete Skimmer Basin to Disposal Well	Zinc/Chromate/Corrosion Inhibitor, Biocide, Dispersant	See attached analysis
3. Sewage	Septic Tank		
4. Wash Down	Infrequent - to engine room pumps to concrete Skimmer Basin to Disposal Well. Variable flows	None	N/A
5. Produced Water/Oil from field	Variable inlet. Slop Oil Tank sold to Western Trucking Co.	None	N/A
6. Office Trash	Dumpster - Picked up weekly by Waste Control of New Mexico	None	N/A
7. Flare Water Knock Out (Condensation)	Infrequent/minute amount 24 GPD hauled off-site by contractor	N/A	None

NOTE: Discharge rates are estimated; however, they should be representative of plant effluent both quantity and quality wise.

Analyses	Well Water	Cooling Tower Blowdown	Engine Jacket Water
1. Total Dissolved Solid (TDS) mg/l	518	mg/l 1300	mg/l 1500
2. Sodium (Na)	39	119	
3. Potassium (k)	39	12	
4. pH 7.2		6.8	8.0
5. Calcium (Ca)	88	206	
6. Magnesium (Mg)	14.4	40	
7. Chlorides (Cl)	130	332	
8. Sulfates (SO_4)	30	187	
9. BiCorbonates $(HC)_3$)	183	337	
10. Carbonates (CO_3)	0	0	

*Engine Jacket Water analysis unavailable at present time. Will be analyzed at a later date.

NOTE: All analyses in mg/l unless otherwise specified.

Analyses for other elements as listed in WQCC Section 3-103 are not shown as the probability of existence of these elements in the waters from this plant is nil.

The contaminants listed in WQCC 1-101.UU are neither used in any process, are intermediates of any products from plant processes nor are contained in the inlet natural gas to the plant. The plant processes straight chain hydro-carbons from field gas through physical separation. No chemicals are used in this process nor are any H-C bonds broken.

Samples of the plant waters (cooling tower, engine jacket and well) were taken as grab samples and analyzed by Unichem Int. for those components as listed in the above. Grab samples were not filtered prior to sampling. Any sampling, preservation techniques, and analytical testings were done according to Standard Methods for the Examination of Water and Wastewater.

Areas in the plant where leaks of oil may occur are either diked to prevent the flow off property or toward process areas. Dikes are designed to

contain more than the maximum stored amount. Engine rooms have sumps which direct engine leakage, washdowns, etc. to a concrete skimmer basin and then to a disposal well. If any oil were to spill, immediate clean up procedures would be initiated with contractors called in to haul spilled oil and contaminated soil off-site for proper disposal. Should the soil quantity spilled exceed OCD notification regulations, the District OCD office would be notified by telephone and followed up with a written report.

Slop oil tanks are all above ground so that any leakage would be noted during regular inspections by operators and supervisor. If leakage were noted, the leaking vessel would be pumped out and the contaminated soil removed for proper disposal. If the vessel could be repaired it would be, otherwise, it would be taken permanently out of service.

The disposal well utilized by the plant is operated by Texaco Producing in Midland. We rely on them for disposal of plant liquid wastes as described herein; however, we are not involved in the permitting, reporting, testing, etc. required by the OCD. Should additional information on the well be required, we can obtain it upon request.

(Continued on reverse side)

SECTION V - HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE: Unknown

EFFECTS OF OVEREXPOSURE: ALPHA 542 is capable of producing serious eye irritation and corneal damage. Prolonged skin contact can cause marked irritation and chemical burn.

EMERGENCY AND FIRST AID PROCEDURES: Flush eyes for 15 minutes with water. Obtain medical attention. Wash affected skin with soap and water. Get medical attention if irritation persists. If ingested, induce vomiting; call a physician.

SECTION VI - REACTIVITY DATA

STABILITY	UNSTABLE		CONDITIONS TO AVOID
	STABLE	X	None

INCOMPATABILITY *(Materials to avoid)*: None

HAZARDOUS DECOMPOSITION PRODUCTS: Toxic gaseous compounds are produced when incinerated.

HAZARDOUS POLYMERIZATION	MAY OCCUR		CONDITIONS TO AVOID
	WILL NOT OCCUR	X	None

SECTION VII - SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED: Wash area thoroughly with soap and water. Rinse thoroughly with fresh water. Do not allow rinse water to drain into lakes or streams.

WASTE DISPOSAL METHOD: Dispose of by burying in an approved landfill or other approved area. Do not allow product to contaminate lakes, streams, ponds or public waters.

SECTION VIII - SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION *(Specify type)*: None likely to be required.

VENTILATION: Control to comfort	LOCAL EXHAUST	SPECIAL
	MECHANICAL *(General)*	OTHER

PROTECTIVE GLOVES: Rubber	EYE PROTECTION: Chemical workers' goggles

OTHER PROTECTIVE EQUIPMENT: Rubber boots, apron and coveralls.

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING: Avoid skin contact, inhalation and ingestion

OTHER PRECAUTIONS: This material can be absorbed through the skin in amounts that can cause death.

PLOT LIMIT

THE GENERAL PLANT DRAINS AND COOLING TOWER BLOWDOWN FLOW TO THE SKIMMER PIT. ALL LIQUIDS IN THE SKIMMER PIT ARE PUMPED TO TEXACO PRODUCTION.

CONDENSATE FROM THE TWO INLET SCRUBBERS, THE FIRST STAGE SCRUBBER, AND FROM THE TEG CONTACTOR INLET SCRUBBER ARE COLLECTED IN THE SLOP OIL TANKS (2@250 BBL). PRIOR TO FLOWING TO THE SLOP OIL TANKS, THE GASES IN THE LIQUID ARE FLASHED TO THE FLARE.

THE SKIMMER OVERFLOW LINE IS NORMALLY BLOCKEDIN. SKIMMER LIQUIDS DRAINED IN AN EMERGENCY ARE HAULED OFF.

Re: Texaco - Buckeye Gas
Processing Plant
Discharge Plan

Dear Mr. Anderson:

We have received your letter dated May 30, 1985, requesting an extension of time for submittal of the Texaco-Buckeye discharge plan. It is our understanding that you intend to submit the discharge plan by June 28, 1985.

Pursuant to Section 3-106.A of the New Mexico Water Quality Control Commission Regulations and for good cause shown, Texaco is hereby granted its request for an extension until June 28, 1985, to submit its discharge plan for the Buckeye gas processing plant.

If you have any questions on this extension, or on the discharge plan process, please feel free to contact Phil Baca at (505) 827-5885, or Jami Bailey at (505) 827-5884.

Sincerely,

R. L. STAMETS

RE: Texaco-Buckeye Gas Processing Plant
Discharge Plan

Dear Mr. Stamets:

We request an extension of time for the completion of the above referenced Discharge Plan at Texaco's Buckeye Gas Processing Plant, from June 5, 1985 to June 28, 1985.

Your cooperation in granting this extension is most appreciated.

Yours very truly,

J. H. Anderson/WAS

Originating Party	Other Parties
P. Baca - OCD	L. Knight - Texaco

Subject: Texaco - Buckeye Gas Plant Discharge Plan

Discussion: Ms. Knight indicated that due to relocation of their office (Pampa, Tx to Tulsa, Ok), he would like an extension until 6-28-85 to submit their discharge plan. I asked him to send a written request.

Conclusions or Agreements: Ms. Knight will send a written request for extension.

ATTENTION: Mr. C. R. Adkison

Dear Mr. Adkison:

Under the provisions of the Water Quality Control Commission (WQCC), you are hereby notified that the filing of a discharge plan is required for your existing Buckeye Gas Processing Plant located in Section 36, Township 17 South, Range 34 East, NMPM, in Lea County, New Mexico.

This notification of discharge plan requirement is pursuant to Sections 3-104 and 3-106 of the WQCC regulations. The discharge plan defined in Section 1-101.P of the WQCC Regulations, should cover all discharges of effluent or leachate at the plant site or adjacent to the plant site. A copy of the regulations is enclosed for your convenience. Also enclosed is a copy of an OCD guide to the preparation of discharge plans for gas processing plants. Four copies of your discharge plan should be submitted for review purposes.

Section 3-106.A. of the regulations requires a submittal of the discharge plan within 120 days of receipt of this notice unless an extension of this time period is sought and approved for good cause. Section 3-106.A. also allows the discharge to continue without an approved discharge plan until 240 days after written notification by the director that a discharge plan is required. An extension of this time may be sought and approved for good cause.

LEWIS KNIGHT - TULSA, OK

If there are any questions on this matter, please feel free to call Dave Boyer or Phil Baca at (505) 827-5812 as they have the assigned responsibility for review of all discharge plans.

Sincerely,

R. L. STAMETS
Director
