| background                     | surface    | 72  |

**General Description of Remedial Action:**

This junction box was addressed as

part of the Vacuum SWD System abandonment. A delineation trench was made at the junction to 6 ft BGS using a backhoe. Soil samples were collected every vertical ft of depth from 2 to 6 ft. Chloride field tests were conducted on these samples and yielded a conclusive trend of decline with depth, indicative of non-saturated vadose conditions. The laboratory analysis of the 6 ft sample confirmed the low concentration of 67.1 ppm, similar to background level. PID screenings performed on the soil samples were all 0.0 ppm and there were no indications of hydrocarbon impact. TPH was not present in detectable concentrations (<10.0 ppm), meeting NMOCD guidelines. The excavated soil was blended on site and then backfilled into the trench. The disturbed surface was seeded with a blend of native vegetation and is expected to return to productive capacity at a normal rate. Because the SWD System is no longer active, a new junction box is not required.

enclosures: photos, lab results, PID field screenings
