GAS CAPTURE PLAN

JUL 12 2018

RECEIVED

Date: 7/12/2018

☒ Original

Operator & OGRID No.: 370080

☐ Amended - Reason for Amendment: _____

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomple to new zone, re-frac) activity.

Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).

Well(s)/Production Facility – Name of facility

The well(s) that will be located at the production facility are shown in the table below.

Well Name	API	Well Location (ULSTR)	Footages	Expected MCF/D	Flared or Vented	Comments
Encore M State No. 022 <i>30-025-48965</i>		P, 20, 22S, 37E	860' FSL 760' FEL	+/-500 MCFD	Piped to Encore M State Tank Battery No.2	Gas captured via flowlines in place. Gas is never flared or vented

Gathering System and Pipeline Notification

Well(s) will be connected to a production facility after flowback operations are complete, if gas transporter system is in place. The gas produced from production facility is dedicated to Targa Resources and will be connected to Targa low/high pressure gathering system located in Lea County, New Mexico via Encore M State Tank Battery #2. It will require 50' of pipeline to connect the facility to Targa meter. Breitburn Operating LP provides (periodically) to Targa Resources a drilling, completion and estimated first production date for wells that are scheduled to be drilled in the foreseeable future. In addition, Breitburn and Targa will have periodic conference calls to discuss changes to drilling and completion schedules. Gas from these wells will be processed at Targa Processing Plant located at 25 Middle Plant LN, Eunice New Mexico (Lea County). (Section 3, T22S, R 37E) The actual flow of the gas will be based on compression operating parameters and gathering system pressures.

Flowback Strategy

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be piped through existing flowline to Encore M State Tank Battery #2. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on Targa Processing system at that time. Based on current information, it is Breitburn's belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation – On lease
 - Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas – On lease
 - Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal – On lease
 - Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
