GAS CAPTURE PLAN

Date: 4-9-19	GAS CAPTURE PLAN	REC
☑ Original☐ Amended - Reason for Amendment:	Operator & OGRID No.: Mewbourne	Oil Company - 14744

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomplete to new zone, re-frac) activity.

Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).

Well(s)/Production Facility - Name of facility

The well(s) that will be located at the production facility are shown in the table below.

 e well (3) that will be located at the production facility are shown in the table ociow.							
Well Name	API	Well Location	Footages	Expected	Flared or	Comments	
		(ULSTR)		MCF/D	Vented

	Laningernu	AV81111111	34 / 11 / 1	B- 1834-9111		C. 24 10 11

Well(s) will be	connected to a pro	duction facility after flo	owback operation	s are complete	, if gas transpo	rter system is in
place. The ga	s produced from p	production facility is de	dicated to west	ern	and will	be connected to
Western	low/high pro	essure gathering system	n located in EDDY	County,	New Mexico.	It will require
3,400 of j	pipeline to connect	the facility to low/high	pressure gatherin	ng system. Me	ewbourne Oil Co	ompany provides
(periodically) to	Western	a drilling, completio	n and estimated fir	st production d	ate for wells that	are scheduled to
be drilled in th	ne foreseeable futur	re. In addition, Mewbo	ume Oil Compan	y and Weste	rn	have periodic
conference cal	s to discuss chang	ges to drilling and com	pletion schedules.	Gas from t	hese wells will	be processed at
Western	Proce	ssing Plant located in Sec	, 36 , Blk. 58 T	15 Culbers	on County, Texas	. The actual flow
of the gas will b	e based on compres	sion operating parameters	and gathering syst	em pressures.		

Flowback Strategy

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on <u>western</u> system at that time. Based on current information, it is <u>Operator's</u> belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation On lease
 - o Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas On lease
 - o Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal On lease
 - o Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
