

## NE MEXICO OIL CONSERVATION COMMISSION

Santa Fe, New Mexico

## MISCELLANEOUS REPORTS ON WELLS

Submit this report in triplicate to the Oil Conservation Commission or its proper agent within ten days after the work specified is completed. It should be signed and sworn to before a notary public for reports on beginning drilling operations, results of shooting well, results of test of casing shut-off, result of plugging of well, and other important operations, even though the work was witnessed by an agent of the Commission. Reports on minor operations need not be signed and sworn to before a notary public. See additional instructions in the Rules and Regulations of the Commission.

Indicate nature of report by checking below:

REPORT ON BEGINNING DRILLING OPERATIONS	<input checked="" type="checkbox"/>	REPORT ON REPAIRING WELL	
REPORT ON RESULT OF SHOOTING OR CHEMICAL TREATMENT OF WELL		REPORT ON PULLING OR OTHERWISE ALTERING CASING	
REPORT ON RESULT OF TEST OF CASING SHUT-OFF		REPORT ON DEEPENING WELL	
REPORT ON RESULT OF PLUGGING OF WELL			

Hobbs, New Mexico

June 4, 1937

Place

Date

OIL CONSERVATION COMMISSION,  
Santa Fe, New Mexico.

Gentlemen:

Following is a report on the work done and the results obtained under the heading noted above at the \_\_\_\_\_

**Repollo Oil Company** **J.R. Phillips "B"** Well No. **4** in the  
Company or Operator Lease  
**NW 1/4** of Sec. **31**, T. **19**, R. **37**, N. M. P. M.,  
**Monument** Field, **Lea** County.

The dates of this work were as follows: **6/4/37**

Notice of intention to do the work was [ ~~was not~~ ] submitted on Form C-102 on \_\_\_\_\_ 19\_\_\_\_  
and approval of the proposed plan was [ ~~was not~~ ] obtained. (Cross out incorrect words.)

## DETAILED ACCOUNT OF WORK DONE AND RESULTS OBTAINED

Commenced Drilling June 4, 1937

Witnessed by **Otis Davis** **Natural Gaso. Corp.**

## THEORY OF THE EARTH

The theory of the earth is a branch of geology which deals with the origin and development of the earth and its various parts. It is a science which seeks to explain the processes which have shaped the earth and its various parts.

### THE EARTH'S CRUST

The earth's crust is the outermost layer of the earth. It is composed of various rocks and minerals. The crust is divided into two main parts: the continental crust and the oceanic crust. The continental crust is thicker and is composed of various types of rocks, including granite, gneiss, and schist. The oceanic crust is thinner and is composed of basalt and other igneous rocks.

### THE EARTH'S MANTLE

The earth's mantle is the layer of the earth beneath the crust. It is composed of various rocks and minerals. The mantle is divided into two main parts: the upper mantle and the lower mantle. The upper mantle is the layer of the mantle closest to the crust. It is composed of various types of rocks, including peridotite and olivine. The lower mantle is the layer of the mantle beneath the upper mantle. It is composed of various types of rocks, including peridotite and olivine.

The earth's core is the innermost layer of the earth. It is composed of various metals, including iron and nickel. The core is divided into two main parts: the outer core and the inner core. The outer core is the layer of the core closest to the mantle. It is composed of various types of metals, including iron and nickel. The inner core is the layer of the core beneath the outer core. It is composed of various types of metals, including iron and nickel.

The earth's atmosphere is the layer of gases surrounding the earth. It is composed of various gases, including nitrogen, oxygen, and carbon dioxide. The atmosphere is divided into two main parts: the troposphere and the stratosphere. The troposphere is the layer of the atmosphere closest to the earth's surface. It is composed of various types of gases, including nitrogen, oxygen, and carbon dioxide. The stratosphere is the layer of the atmosphere beneath the troposphere. It is composed of various types of gases, including nitrogen, oxygen, and carbon dioxide.

The earth's hydrosphere is the layer of water surrounding the earth. It is composed of various bodies of water, including oceans, seas, and lakes. The hydrosphere is divided into two main parts: the surface hydrosphere and the deep hydrosphere. The surface hydrosphere is the layer of water closest to the earth's surface. It is composed of various types of water, including oceans, seas, and lakes. The deep hydrosphere is the layer of water beneath the surface hydrosphere. It is composed of various types of water, including oceans, seas, and lakes.

The earth's biosphere is the layer of life surrounding the earth. It is composed of various organisms, including plants, animals, and microorganisms. The biosphere is divided into two main parts: the terrestrial biosphere and the aquatic biosphere. The terrestrial biosphere is the layer of life closest to the earth's surface. It is composed of various types of organisms, including plants, animals, and microorganisms. The aquatic biosphere is the layer of life beneath the terrestrial biosphere. It is composed of various types of organisms, including plants, animals, and microorganisms.

The earth's geosphere is the layer of the earth's interior. It is composed of various rocks and minerals. The geosphere is divided into two main parts: the upper geosphere and the lower geosphere. The upper geosphere is the layer of the geosphere closest to the crust. It is composed of various types of rocks and minerals, including peridotite and olivine. The lower geosphere is the layer of the geosphere beneath the upper geosphere. It is composed of various types of rocks and minerals, including peridotite and olivine.

The earth's lithosphere is the layer of the earth's crust. It is composed of various rocks and minerals. The lithosphere is divided into two main parts: the continental lithosphere and the oceanic lithosphere. The continental lithosphere is the layer of the lithosphere closest to the crust. It is composed of various types of rocks and minerals, including granite, gneiss, and schist. The oceanic lithosphere is the layer of the lithosphere beneath the continental lithosphere. It is composed of various types of rocks and minerals, including basalt and other igneous rocks.

The earth's asthenosphere is the layer of the earth's mantle. It is composed of various rocks and minerals. The asthenosphere is divided into two main parts: the upper asthenosphere and the lower asthenosphere. The upper asthenosphere is the layer of the asthenosphere closest to the crust. It is composed of various types of rocks and minerals, including peridotite and olivine. The lower asthenosphere is the layer of the asthenosphere beneath the upper asthenosphere. It is composed of various types of rocks and minerals, including peridotite and olivine.

The earth's core is the innermost layer of the earth. It is composed of various metals, including iron and nickel. The core is divided into two main parts: the outer core and the inner core. The outer core is the layer of the core closest to the mantle. It is composed of various types of metals, including iron and nickel. The inner core is the layer of the core beneath the outer core. It is composed of various types of metals, including iron and nickel.

The earth's atmosphere is the layer of gases surrounding the earth. It is composed of various gases, including nitrogen, oxygen, and carbon dioxide. The atmosphere is divided into two main parts: the troposphere and the stratosphere. The troposphere is the layer of the atmosphere closest to the earth's surface. It is composed of various types of gases, including nitrogen, oxygen, and carbon dioxide. The stratosphere is the layer of the atmosphere beneath the troposphere. It is composed of various types of gases, including nitrogen, oxygen, and carbon dioxide.

The earth's hydrosphere is the layer of water surrounding the earth. It is composed of various bodies of water, including oceans, seas, and lakes. The hydrosphere is divided into two main parts: the surface hydrosphere and the deep hydrosphere. The surface hydrosphere is the layer of water closest to the earth's surface. It is composed of various types of water, including oceans, seas, and lakes. The deep hydrosphere is the layer of water beneath the surface hydrosphere. It is composed of various types of water, including oceans, seas, and lakes.
