☐ Plugging ☒ Other Casinghead installation
Casing leak inspection

Detailed account of work done, nature and quantity of materials used and results obtained.

For the purpose of testing oil string and intermediate casing for leaks, the cellar was excavated and 2" tubing risers brought to ground level from both surface and intermediate casingheads. Valves were installed on lines above ground level. For purposes of identification, the pipe connecting to surface head was stamped with letters "SUR" and that connecting to the intermediate head with the letters "INT". On April 11, 1957, an inspection was made by Mr. E. Engbrecht, Oil and Gas Inspector, NMOCC, to ascertain that all valves and lines were open between ground level and the casingheads. The cellar was then filled with earth.
