Closed-Loop **DESIGN PLAN:**

The closed-loop system will not use a drying pad, temporary pit, below-grade tank or sump of any kind. The system will use an above-ground, settling tank suitable for holding the drill cuttings from the well and fluids for rig operations. The settling tank will be of sufficient volume to maintain a safe free board between disposal of the solids and liquids from rig operations.

- 1) Fencing is not required for an above-ground, closed-loop system.
- 2) The site will be signed in accordance with 19.15.3.103 NMAC.
- 3) Attached is a rig layout diagram. Haul off bins will be installed just off the shaker pit to facilitate loading and hauling the bins.

Closed-Loop OPERATING AND MAINTENANCE PLAN

In order to protect public health and the environment, the closed-loop system will be operated to contain liquids and solids. This will aid in the prevention of contamination of fresh water sources. The following steps will be followed to ensure the proper operation and maintenance of the system:

- 1) All equipment and operations will be inspected and a log will be signed and dated recording same. The inspection will be daily when the rig is operating.
- 2) Hazardous waste, miscellaneous solid waste, or debris will not be discharged into or stored in the tanks; only fluids used in or cuttings generated by rig operations will be placed/stored in the bins.
- 3) The solids and liquids in the closed-loop, tanks will be transported from the drilling facility and disposed of at the Gandy Marley Inc. Facility (Permit No. NM 01-0019) when a bin is determined to be full.
- (4) Operations will be suspended and repairs will be enacted immediately upon the discovery of a compromised haul-off bin or associated equipment. The NMOCD District Office will be notified within 48 hours of any such discovery.

Closed-Loop CLOSURE PLAN

- 1) The tanks will be maintained in accordance with 19.15.17.13 NMAC.
- 2) All cuttings and liquids will be transported to the Gandy Marley, Inc. Facility for disposal during rig operations and immediately following the completion of rig operations. Tanks, pump & rig will be removed from location.
- 3) The site will be reclaimed and re-vegetated to pre-existing conditions at the time the well is permanently abandoned.

Celero Energy II LP NCCQU #32-4 API 30-025-00209 1980 FSL & 660 FWL Unit L, Section 32, T-12S, R-32E Lea County, N. Mexico

Procedure to re-enter plugged well and return to production.

- 1. Blade off a 200'-by-200' location.
- Dig out well head and install cellar. Dress off casing stubs and install risers for 10-3/4" and 7" casing. Install 10-3/4"-by-7", minimum 2000 psi WP, SOW, Larkin-style casing head with two outlets. Install minimum 2000 psi WP Larkin-style casing head on 7" casing.
- 3. RU pulling unit. Install hydraulically-operated, dual-ram (blinds on bottom) 5000 psi WP BOPE and test to 1000 psi. RU tubing swivel and reverse unit pump taking returns off casing head outlet with single line to return tank. Open and monitor the 7"-by-10-3/4" outlet for returns during drill out.
- 4. RIH with 6-1/4" bit, bit sub, (6) 2-3/8" regular DC's(3-1/8" OD) on 2-7/8", 6.5#, J-55, 8rd EUE workstring. Drill out cement from surface and pressure test to 500 psi (discuss w/office before proceeding). Tag next plug at 1332', and pressure test to 500 psi (discuss w/office before proceeding). Tag next plug at 2820', and pressure test to 500 psi (discuss w/office before proceeding). Drill out cement at 2820'-2950'. Continue drilling out and clean out to 5-1/2" liner top at 2983'. TOOH, change to 4-3/4" bit and clean out to original TD of 3043'. Circulate hole clean using produced water. POOH standing back workstring.
- RU wireline unit and run a casing inspection log from 2983' to surface. Run a GR/CCL/CBL from 3013' to T-O-C. Discuss results with office before proceeding. Run a GR/CCL/CNL from TD to 2000'.
- 6. RIH with retrievable treating packer and acidize the existing open hole with 1500 gals inhibited 7-1/2% NEFE HCL containing 10% xylene at maximum rate without exceeding 4000 psi surface treating pressure. Pump 10 gals gelled 10-ppg brine water containing 750# of graded rock salt after the first 750 gals of acid/xylene mixture. Flush with tubing volume plus 20 bbls of freshwater. Record initial, 15-minute, and 30-minute shut-in pressures.
- Swab back load recording initial and final fluid levels. TOOH w/treating packer and LD workstring. RIH with plastic-coated AD-1 packer on 2-3/8", 4.7#, J-55, 8rd EUE IPC tubing and set packer at 2970'. Circulate hole with freshwater packer fluid and pressure test. Schedule and perform MIT. Shut in waiting on injection facilities.
