MCA Unit 456 Justification and Proposed Change 11/4/13

Justification for Proposed Change:

If the flow continues at 35 bph or higher and the use of a stage tool and annulus casing packer(s) to isolate water flow becomes necessary, then ConocoPhillips respectfully requests revision to the provided contingency option to the Production Casing and Cementing Program. The intention is to isolate water flows from the Salado down to the Grayburg above the top of perfs, if well is still flowing at these rates prior to casing and cementing the production section.

Proposed Change:

5-1/2" Production Casing Cementing Program – Two-Stage Contingency Cementing Option:

We propose a revision to the two-stage contingency cementing program for MCA #456 as follows:

 Position a Stage Tool at 990' MD immediately below the surface casing shoe and Annulus Casing Packer (upper) immediately below the Stage Tool at 1,000' MD.

Note: This is to provide isolation immediately below the surface casing shoe to allow placement during 2nd stage of good uncontaminated 14.8 ppg cement in casing-casing annulus.

- Position one more Annulus Casing Packer (lower) above the top of perfs at 3,800' MD.
- Pump the 1st Stage cement from the production casing shoe to surface.

Stage 1 - Slurry		Intervals Ft MD		Weight PPg	Sx	Vol bbl	Additives	Yield ft³/sx
Lead	C Gas Tight Slurry	Surface	3000'	11.5	450	259	Class C 94 lb/sx 6% Extender 10% Gas Migration Control 2% Sodium Metasilicate (dry) 1% Cement Bonding Agent 3% Aluminum Silicate 0.125 lb/sx Cello Flake 3 lb/sx LCM-1	3.23
Tail	Poz/C Gas Tight Slurry	3000'	4330′ – 4375′	14.0	320	78	(35:65) Poz:C 33 lb/sx 1% Sodium Metasilicate (dry) 1.5% Fluid Loss Control,	1.37

Spacer: 20 bbls Fresh Water

- Drop the wiper plug and displace 1st stage cement with 61 bbl FW and 40 bbl of 14.8 ppg Spacer. Bump the wiper plug.
- Pressure up to inflate the upper Annulus Casing Packer and then pressure up more to inflate lower Annulus Casing Packer (slightly higher pin settings).
- Observe displacement and confirm inflation of Annulus Casing Packers. Note and report the excess cement return to surface.
- Monitor the well to observe if the well is static and the Packers have isolated the flow to surface. Weigh cement returns with pressurized mud scale to ensure cement is uncontaminated with brine from flow zones.

- If cement returns are uncontaminated drop the cancelation plug and disable the Stage Tool.
 - If the cement indicates brine-cut contamination or flow is observed while the well is static, then proceed with further contingency below:
 - Drop an opening bomb to open the Stage Tool, and proceed with the cement job out annulus above the upper ACP through the Stage Tool. Note and Record the amount of cement circulated to surface.
 - Begin 2nd stage cement.

Spacer: Remaining 14.5 ppg Ultra Flush in cementing lines from the 40 bbl 1st stage displacement.

Stage 2 - Slurry		Intervals Ft MD		Weight ppg	Sx	Vol bbl	Additives	Yield ft³/sx
Tail	Class C	Surface	Stage Tool ~ 930'	14.8	250	60	Class C 94 lb/sx 1% CaCl2	1.335

- Drop the closing plug and displace 2nd stage cement with 23 bbl FW. Bump the closing plug.
- Pressure up to close the Stage Tool.
- o Observe and report if there was excess cement return to surface.
- Wash/Rinse wellhead and BOP stack with sugar water thru kill line. Close all outlet valves and fill the wellhead and BOP stack with sugar water.
- o Close annular BOP for 3 hours until cement reaches 100 psi compressive strength.
- Bleed pressures off and check for flow and verify zero pressure at surface.

Proposal for Option to Adjust Production Casing Cement Volumes:

Also, if no caliper log is available, we would propose an option to possibly increase the production casing cement volume to ensure additional excess cement for cement returns to surface.

CONDITIONS OF APPROVAL

Sundry dated 11/4/2013

OPERATOR'S NAME: LEASE NO.: WELL NAME & NO.: SURFACE HOLE FOOTAGE: LOCATION: COUNTY: CONOCOPHILLIPS LC058698A 456-MCA UNIT 1780' FSL & 280' FWL Section 26, T. 17 S., R 32 E., NMPM Lea County, New Mexico

1. The minimum required fill of cement behind the **5-1/2 inch production casing** is:

DV tool shall be set a minimum of 50' below previous shoe

a. First stage to DV tool:

**** Cement to circulate. If cement does not circulate, contact the appropriate BLM office before proceeding with second stage cement job. Operator should have plans as to how they will achieve circulation on the next stage.

Operator has proposed a contingency DV tool at 1002'- Operator to attempt to lower the tool another 15 feet if possible. If operator circulates cement on the first stage and the cement returns are uncontaminated, operator is approved to run the DV tool cancellation plug and cancel the second stage of the proposed cement plan. If cement does not circulate and or cement indicated brine-cut contamination or flow is observed while the well is static, then the operator will inflate ACP and proceed with the second stage.

b. Second stage above DV tool:

***Cement to surface. If cement does not circulate, contact the appropriate BLM office.
