MCA Unit 451 Justification and Proposed Change 11/10/13

Justification for Proposed Change:

If the flow continues prior to casing and cementing and the use of a stage tool and annulus casing packer(s) to isolate water flow becomes necessary, then ConocoPhillips respectfully requests revision to the provided contingency option to the Production Casing and Cementing Program. The intention is to isolate water flows from the Salado down to the Grayburg above the top of perfs, if well is still flowing at these rates prior to casing and cementing the production section.

Proposed Change:

5-1/2" Production Casing Cementing Program - Two-Stage Contingency Cementing Option:

We propose a revision to the two-stage contingency cementing program for MCA #451 as follows:

 Position a Stage Tool at 1090' MD immediately below the surface casing shoe and Annulus Casing Packer (upper) immediately below the Stage Tool at 1,092' MD.

Note: This is to provide isolation immediately below the surface casing shoe to allow placement during 2nd stage of good uncontaminated 14.8 ppg cement in casing-casing annulus.

- Position one more Annulus Casing Packer (lower) above the top of perfs at 3,800' MD.
- Pump the 1st Stage cement from the production casing shoe to surface.

Spacer: 20 bbls Fresh Water

Sta	ge 1 - Slurry	Interva Ft N	-	Weight ppg	Sx	Vol bbl	Additives	Yield ft³/sx	
Lead	C Gas Tight Slurry	Surface	3000′	11.5	450	259	Class C 94 lb/sx 6% Extender 10% Gas Migration Control 2% Sodium Metasilicate (dry) 1% Cement Bonding Agent 3% Aluminum Silicate 0.125 lb/sx Cello Flake 3 lb/sx LCM-1	3.23	
Tail	Poz/C Gas Tight Slurry	3000'	4,445′ - 4,490′	14.0	320	78	(35:65) Poz:C 33 lb/sx 1% Sodium Metasilicate (dry) 1.5% Fluid Loss Control,	1.37	

- Drop the wiper plug and displace 1st stage cement with 61 bbl FW and 40 bbl of 14.8 ppg
 Spacer. Bump the wiper plug.
- Note and report the excess cement return to surface. Weigh cement returns with pressurized mud scale to ensure cement is uncontaminated with brine from flow zones.
- Pressures up to inflate the upper Annulus Casing Packer and then pressure up more to inflate lower Annulus Casing Packer (slightly higher pin settings).
- Observe displacement and confirm inflation of Annulus Casing Packers.
- Monitor the well to observe if the well is static and the Packers have isolated the flow to surface.

- If cement returns are uncontaminated and the well is static drop the cancelation plug and disable the Stage Tool.
 - o If the cement indicated brine-cut contamination or flow was observed after inflation of the ACPs, then proceed with further contingency below:
 - Drop an opening bomb to open the Stage Tool, and proceed with the 2nd stage cement job out the annulus above the upper ACP through the Stage Tool. Note and Record the amount of cement circulated to surface.
 - o Begin 2nd stage cement.

Spacer: Remaining 14.5 ppg Ultra Flush in cementing lines from the 40 bbl 1st stage displacement.

	Stage 2 - Slurry Intervals Ft MD			Weight ppg	Sx	Vol bbl	Additives	Yield ft³/sx	
1	Гаil	Class C	Surface	Stage Tool ~ 1090'	14.8	250	60	Class C 94 lb/sx 1% CaCl2	1.335

- O Drop the closing plug and displace 2nd stage cement with 23 bbl FW. Bump the closing plug.
- o Pressure up to close the Stage Tool.
- Observe and report if there was excess cement return to surface.
- Wash/Rinse wellhead and BOP stack with sugar water thru kill line. Close all outlet valves and fill the wellhead and BOP stack with sugar water.
- o Close annular BOP for 3 hours until cement reaches 100 psi compressive strength.
- o Bleed pressures off and check for flow and verify zero pressure at surface.

Proposal for Option to Adjust Production Casing Cement Volumes:

Also, if no caliper log is available, we would propose an option to possibly increase the production casing cement volume to ensure additional excess cement for cement returns to surface.

Conditions of Approval

100

1. The minimum required fill of cement behind the 5-1/2 inch production casing is:

DV tool shall be set a minimum of 50 feet below surface casing shoe.

	•		the state of the same of the		•	•	•
. 🛛	Cement to circula before proceeding how they will ach	g with sec	ond stage of	cement job.	Operato		

b. Second stage above DV tool:

a. First stage to DV tool:

☐ Cement to surface. If cement does not circulate, contact the appropriate BLM office.
