**GAS CAPTURE PLAN**

Date: 5-28-19

X Original

Operator & OGRID No.: Catena Resources Operating, LLC (328449)

☐ Amended - Reason for Amendment: \_\_\_\_\_

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomple to new zone, re-frac) activity.

*Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).*

**Well(s)/Production Facility – Name of facility**

The well(s) that will be located at the production facility are shown in the table below.

| Well Name & Number | API                      | SHL (ULSTR) | SHL Footages         | Expected MCF/D | Flare or Vent | Comments                             |
|--------------------|--------------------------|-------------|----------------------|----------------|---------------|--------------------------------------|
| Cable 19 35 09 1H  | 30-025-                  | M-4-19s-35e | 193' FSL & 1054' FWL | ≈1,000         | <30 days      | flare until well clean, then connect |
| Cable 19 35 09 2H  | 30-025- <del>46139</del> | M-4-19s-35e | 192' FSL & 1153' FWL | ≈250           | <30 days      | flare until well clean, then connect |

**Gathering System and Pipeline Notification**

Catena Resources Operating, LLC is negotiating with gathers, but has not finalized plans. One possibility is Catena's existing gas connection with Targa, 1-1/4 mile SE in NENE Section 16. Well will be connected to a production facility after flowback operations are complete, if gas transporter system is in place. The gas produced from production facility is not yet dedicated, but will be connected to a 3<sup>rd</sup> party gathering system located in Lea County, New Mexico. It will require an unknown length of pipeline to connect the facility to a gathering system. Catena Resources Operating, LLC will provide (periodically) to Gas Transporter a drilling, completion and estimated first production date for wells that are scheduled to be drilled in the foreseeable future. In addition, Catena Resources Operating, LLC and Gas Transporter will have periodic conference calls to discuss changes to drilling and completion schedules. Gas from these wells will be processed at an unknown Processing Plant located in Lea County, New Mexico. The actual flow of the gas will be based on compression operating parameters and gathering system pressures.

**Flowback Strategy**

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on Gas Transporter system at that time. Based on current information, it is Catena Resources Operating, LLC's belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

**Alternatives to Reduce Flaring**

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation – On lease
  - Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas – On lease
  - Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal – On lease
  - Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
