Re: Site Status - Historic BLM 16" Pipeline Site
Lea County, New Mexico

Dear Mr. Lacewell:

Attached with this letter is a summary of current site activities conducted at the Historic BLM 16" Pipeline Release Site in Lea County, New Mexico. If you have any questions or comments, please do not hesitate to call me at (972) 247-1700.

Respectfully,
Shell Oil Products US

Scott E. Burkey
Environmental Specialist

RE: HISTORIC BLM 16" PIPELINE SITE-CRUDE OIL RELEASE STATUS LEA COUNTY, NEW MEXICO

Mr. Burkey:

This letter details the recent past history of the above mentioned site

Project Background

The site is a historical crude oil release from a former Texas-New Mexico Pipeline Company crude pipeline located in section 30 township 18 south and range 32 east in Lea County, New Mexico. The release occurred in the 1950's.

In 1997 and 1998, 10 soil borings and 10 surface soil augerings were advanced at the site by KEI Consultants, Inc. of San Antonio, Texas. Laboratory analytical results from the soil samples obtained during the investigation indicated TPH and BTEX concentrations in excess of the NMOCD cleanup levels of 5,000 ppm TPH, 10 ppm Benzene, and 50 ppm Total BTEX. Groundwater was not encountered during the installation of the borings, and is expected to be present at depths of approximately 170 feet below ground surface (bgs).

In December 2001, nine additional soil borings were advanced to determine if hydrocarbon concentrations had been reduced by intrinsic bioremediation to levels below NMOCD action levels. The results of this investigation demonstrated that intrinsic bioremediation has reduced the TPH and BTEX concentrations previously observed in the onsite soils to levels below the NMOCD ranking criteria. The site meets the criteria for closure through the NMOCD.

On February 20, 2003, Enercon Services, Inc. contacted Mr. Link Lacewell of the BLM Carlsbad, New Mexico office in regards to reseeding the site. Mr. Lacewell conferred

with the BLM biologist and suggested the following mixture of seed for prairie chicken habitate such as is the site:

Species	Lb/Acre (pls)
Plains Bluestem	5
Sand Bluestem	5
Little Bluestem	3
Big Bluestem	6
Sand Dropseed	0.5
Mesa Dropseed	0.5
Plains Cereopsis	2

From May 28 through May 29, 2003, Stewart Welding, Inc. of Andrew, Texas tilled the site and placed approximately 300 pounds of the above mentioned mixture of seed onsite (See attached photographs). The only surface disturbance to the site was confined to areas previously impacted by the release. A subsequent site visit on July 15, 2003, determined that the planted seed has not taken hold at the site.

If you have any questions or are in need of additional information please do not hesitate to call me at (432) 570-8726 or (432) 631-6592.

Respectfully,
Enercon Services, Inc.
Jeffrey W. Kindley, P.G.
Project Manager

Re: Subsurface Investigation
Texas - New Mexico Pipe Line Company
16" Historical Release
Lea County, New Mexico
KEI Job No. 610100

Dear Mr. Gripp:

This letter is the Subsurface Investigation Report for field activities conducted March 10 and 11, 1997, at the 16" historical release located on Bureau of Land Management (BLM) land south of Highway 529 in Lea County, New Mexico. The information included herein addresses the purpose and scope of the investigation, the field investigation and analytical results, conclusions, and recommendations.

PURPOSE AND SCOPE

The primary purposes of the investigation were to:

- Identify the distribution of subsurface hydrocarbon across the site.
- Collect soil samples for analysis of hydrocarbon concentrations.
- Install temporary wells for sampling of ground water, if encountered during drilling.

The scope of work during the subsurface investigation included advancing 10 soil borings, collecting native soil samples, collecting ground water samples (if encountered during drilling), and submitting selected samples for determination of total petroleum hydrocarbons (TPH) and benzene, toluene, ethylbenzene, and xylenes (BTEX) concentrations. Ground water was not encountered during drilling. Therefore, only native soil samples were collected and submitted for BTEX and TPH analyses.

FIELD INVESTIGATION RESULTS

SUBSURFACE INVESTIGATION

During the subsurface investigation, ten borings, designated B-1 through B-10A, were advanced at the site utilizing a truck-mounted, hydraulically powered direct-push unit. Soil samples were collected continuously from the ground surface to the termination boring depth. The soils were classified in the field, soil samples were field screened using a photoionization detector (PID), and selected samples were prepared and shipped to the laboratory for determination of BTEX and TPH concentrations. A Site Plan with the approximate locations of the soil borings and other site details is presented as FIG. 1.

All drilling and sampling equipment was cleaned prior to first use, between boring locations, and between sampling intervals with a Liqui-Nox detergent wash followed by a double water rinse.

A geologic cross section indicating the subsurface soil profile, depths at which soil samples were obtained from each boring, head-space results, laboratory results, and generalized geologic profiles is presented as FIG. 2.

SOIL CLASSIFICATION

A subsurface soil profile was developed in general accordance with the Unified Soil Classification System by visually observing soil samples obtained during the subsurface investigation. In general, two soil types were encountered. A general description of the soil, approximate thickness, and head-space sample results for each soil type are as follows:

Soil Type I

This soil type consisted of a reddish-orange to brown sand (SM) and was encountered at depths ranging from 0 to 36 feet below ground surface. This soil type was observed at all soil boring locations. The sand was silty and moist. This soil type varied in thickness from approximately 1.0 to 20.0 feet. The head-space readings from samples of this soil type ranged from ND to 1,951 ppm.

Soil Type II

This soil type consisted of a tan gravel (GM) and was encountered at depths ranging from 1.0 to 34.5 feet below ground surface. This soil type was observed at all soil boring locations. The gravel was silty, sandy, and moist. This soil type varied in thickness from approximately 1.0 to 16.0 feet. The head-space readings from samples of this soil type ranged from ND to 1,314 ppm.

SOIL SAMPLING AND ANALYTICAL RESULTS

Samples of the subsurface soils were obtained by hydraulically pushing a four foot long, 1.75 inch internal diameter core sampler equipped with disposable liners. In three of the borings, refusal was encountered prior to attaining the planned total depth. Soil boring B-10 continually collapsed during advancement. Therefore, B-10 was terminated at eight feet below ground surface and soil boring B-10A was advanced adjacent to B-10.

Representative soil samples were divided into two separate portions using clean, disposable gloves and clean sampling tools. One portion of the soil sample was placed in a disposable sample bag. The bag was sealed and labeled for head-space analysis using a photoionization detector (PID) calibrated to a 100 ppm isobutylene standard. Each sample was allowed to volatilize for approximately 30 minutes at ambient temperature prior to conducting the analysis.

The other portion of the soil sample was placed in a sterile glass container equipped with a Teflon-lined lid furnished by the analytical laboratory. The container was filled to capacity with soil to limit the amount of head-space present. Each container was labeled, placed on ice in an insulated cooler, and chilled to a temperature of approximately 40° F (4° C). Upon selection of samples for laboratory analysis, the cooler was sealed for shipment to the laboratory. Proper chain-of-custody documentation was maintained throughout the sampling process.

Two to four soil samples were selected from each soil boring based on the following criteria:

- The sample with the highest head-space reading.
- The sample at the bottom of each boring.

Soil samples obtained during drilling were delivered to Xenco Laboratories in San Antonio, Texas for determination of TPH concentrations by EPA Method 418.1 and BTEX concentrations by EPA Method SW846-8020. Laboratory concentration ranges for soil samples collected during the subsurface investigation are presented below:

Parameter	**Concentration Range (mg/kg)**
Benzene	ND to 1.08
BTEX	ND to 38.47
TPH	ND to 33,600

Laboratory results are summarized in TABLE I. Copies of the certified laboratory report and chain-of-custody documentation are attached.

CLEAN-UP OBJECTIVES

The following preliminary assumptions have been made in calculating closure objectives:

1. Ground water at the site is at a depth of approximately 170 feet below ground surface.
2. The site is greater than 1,000 feet from a water source.
3. The site is greater than 200 feet from a private domestic water source.
4. The site is greater than 1,000 feet from a surface water body.

Based on these assumptions, the calculated State of New Mexico Oil Conservation Division cleanup levels for this site are as follows:

Parameter	Concentration (ppm)
Benzene	10
BTEX	50
TPH	5,000

CONCLUSIONS

The following conclusions are derived from field observations and analytical data obtained during the subsurface investigation:

- All of the soil samples exhibited benzene and BTEX concentrations below the cleanup objectives of 10 mg/kg and 50 mg/kg, respectively.
- Approximately 68% of the soil samples exhibited TPH concentrations below the cleanup objective of 5,000 mg/kg.
- Eight of the ten borings exhibited no detectable TPH concentrations in their bottom hole samples. The two bottom hole samples with detectable TPH concentrations were both below the cleanup objective of 5,000 mg/kg (36 mg/kg and 4,250 mg/kg, respectively).
- Eight of the ten borings exhibited no detectable BTEX concentrations in their bottom hole samples. The two bottom hole samples with detectable BTEX concentrations were both below the cleanup objectives for benzene and BTEX.
- In general, the vertical extent of hydrocarbon has been delineated at the site. Only one boring showed any significant hydrocarbon concentrations from the bottom hole sample. This boring was terminated at a shallower depth than the adjacent borings that exhibited no detectable hydrocarbon concentrations at the bottom of the hole.
- Ground water at the site is at a depth greater than 36 feet below ground surface. A review of available water well records in the general area suggests the depth to initial ground water is approximately 170 feet below ground surface.

RECOMMENDATIONS

KEI recommends the following:

- A sensitive receptor survey be conducted within 1,000 feet of the site to confirm assumptions 2, 3 and 4.
- Advancement of two additional soil borings in the area of the borings which exhibited the two highest TPH concentrations (B-1 and B-6). Soil samples should be collected at the bottom of the borings and submitted for determination of TPH and SPLP TPH.
- Collection of one undisturbed soil sample for determination of engineering index soil parameters.
- Install one monitoring well to confirm depth to ground water.
- A risk assessment should be conducted to address health and safety concerns to humans, endangered species, and the environment in the vicinity of the site.

Please review this report and return your comments to our office by June 30, 1997. Please call me at (210) 680-3767 if you have any questions or need additional information.

Respectfully,

Paul B. Hartnett, P.E.

Phase II Investigation Report
Equilon Pipeline Company
BLM Historical 16" Pipeline
Former Texas-Mew Mexico Pipeline
Lea County New Mexico

Mr. Price,

Attached is the Phase II Investigation report for the BLM 16" Historical Release site on the former Texas-New Mexico Pipeline. As indicated in the report TPH and BTEX analytical results are below NMOCD guidelines for closure. Therefore we are requesting a "No Further Action" status for this site. Should you have any questions or comments concerning this letter or attached report, please contact my office at (281) 353-2069

Sincerely

RE: Phase II Subsurface Investigation
Equilon Pipeline Company
BLM Historical 16" Pipeline Release
Texas-New Mexico Pipe Line Company
Lea County, New Mexico

Dear Mr. Landreneau:

Enercon Services, Inc. (Enercon) has completed a Phase II Subsurface Investigation at the above referenced site. The investigation was conducted in accordance with the Work Plan previously submitted to Mr. Link Lacewell of the Carlsbad Field Office, Bureau of Land Management on September 17, 2001. The results of the investigation are presented in the following report.

Background

In March, 1997, KEI, an environmental consulting firm, performed a subsurface investigation on the subject site to determine the spatial distribution of crude oil impacted soils from a previous pipeline release. During the investigation, a total of 10 soil borings were installed to depths of 36 feet below ground surface (bgs) to obtain soil samples for laboratory analysis. Soil samples obtained during this investigation were analyzed for benzene, toluene, ethylbenzene, total xylenes (BTEX) and total petroleum hydrocarbons (TPH). Laboratory analytical results from soil samples obtained during this investigation indicated benzene concentrations ranging from below the detection limit to 1.08 parts per million (ppm), BTEX concentrations ranging from below the detection limit to 38.47 ppm, and TPH concentrations ranging from below the detection limit to 33,600 ppm. The majority of soil TPH contamination exceeding the cleanup level of 5,000 ppm was concentrated in the 1-foot to 15-foot bgs range. Although the depth of soils exhibiting TPH concentrations in excess of the NMOCD cleanup level was relatively shallow, the spill outline was approximately 2,100 feet long and an average of 100 feet wide, covering an area of approximately 210,000 square feet, or 4.8 acres. Ground water was not

encountered during the installation of the borings, and is expected to be present at depths of approximately 170 feet bgs.

In June, 1998 KEI conducted surface soil sampling on 10 grid cells laid out between borings B-3 and B-4. Soil samples were obtained from the 0 to 1 foot bgs intervals and analyzed for BTEX and TPH. Two composite samples were also analyzed for polynuclear aromatic hydrocarbons (PAHs), total Kjeldahl nitrogen (TKN), and total potassium (TP) concentrations. Analytical results indicated BTEX concentrations below the detection limit and TPH concentrations ranging from 326 ppm to 2,130 ppm. PAH concentrations ranged from below the detection limit to 0.7 ppm, all of which was phenanthrene. TKN concentrations ranged from 200 to 201 ppm, and TP concentrations ranged from 310 to 344 ppm.

On September 17, 2001, Equiva Services, LLC. submitted a Work Plan to Mr. Link Lacewell of the Carlsbad Field Office, Bureau of Land Management for further subsurface investigation. The purpose of the investigation proposed in the Work Plan was twofold: 1) To better define the horizontal and vertical distribution of soil TPH contamination, and 2) To obtain recent samples for laboratory analysis to determine the rate of intrinsic bioremediation that was occurring at the site. The Work Plan called for the installation and sampling of an additional nine soil borings, located midway between each of the existing borings. It was first determined that the subject site is RCRA Subtitle C exempt, and therefore subject to regulation by the New Mexico Oil Conservation Division (NMOCD). Closure values were determined for this site by using the NMOCD ranking criteria. The soil contamination is classified as Unsaturated Contaminated Soils and depth to groundwater is greater than 100 feet bgs. There are no surface bodies of water within 1,000 horizontal feet of the subject site and the site is greater than 1,000 feet from a water source. The total ranking score, according to NMOCD guidelines for the site is, therefore, zero (0). Accordingly, for a site ranked between 0 and 9, cleanup levels are as follows:

Constituent	**Concentration**
Benzene	10 ppm
BTEX	50 ppm
TPH	5,000 ppm (above background)

A maximum of two soil samples were to be obtained from each boring, based on visual and olfactory field screening, and forwarded to an analytical laboratory for analysis for total petroleum hydrocarbons (TPH).

December 2001 Subsurface Investigation

Mr. Jeff Kindley, of Enercon, was present onsite on December 7, 2001, to oversee the installation and sampling of nine soil borings. Each boring was located approximately midway between the borings installed in 1997 by KEI, as shown on the attached Figure 1. The borings were to be drilled to depths of approximately 15 feet bgs in order to evaluate the most heavily impacted zones, as previously identified. Borings SB-1 through SB-4

and boring SB-8 were terminated at 15 feet bgs. Because borings SB-5, SB-6, SB-7, and SB-9 encountered hydrocarbon odors at the target total depth (TD) of 15 feet, drilling continued on those borings until slight or no hydrocarbon odor was evident in the cuttings. Boring SB-5 was drilled to a TD of 30 feet bgs; boring SB-6 was drilled to a TD of 20 feet bgs; boring SB-7 was drilled to a TD of 50 feet bgs, and boring SB-9 was drilled to a TD of 40 feet bgs.

Drilling was accomplished using an air rotary mobile drilling rig. Soil samples were obtained on 5-foot centers using a split spoon sampling device. Soil samples were packed into factory cleaned 4-oz. glass sample jars, sealed with a teflon-lined lid, and placed on ice for transportation to the analytical laboratory where they were analyzed in accordance with the previously submitted Work Plan. All sampling equipment was decontaminated between samples by scrubbing in an Alconox/tap water solution, followed by a tap water rinse.

Boring logs and sample descriptions are presented in Attachment A.

Laboratory analytical results of soil samples obtained during this investigation are presented below and in Attachment B.

Table 1
TPH Analytical Results
BLM 16-Inch Pipeline Release
Lea County, New Mexico

Boring No.	Depth	TPH DRO (ppm)	TPH GRO (ppm)	Total (ppm)	NMOCD Maximum (ppm)
SB-1	3 – 5'	<50.0	<1.00	BDL	5,000.00
	13 – 15'	<50.0	<1.00	BDL	5,000.00
SB-2	3 – 5'	<50.0	<1.00	BDL	5,000.00
	13 – 15'	<50.0	<1.00	BDL	5,000.00
SB-3	8 – 10'	551.0	39.50	590.50	5,000.00
	13 – 15'	502.0	11.70	513.70	5,000.00
SB-4	3 – 5'	<50.0	4.21	4.21	5,000.00
	13 – 15'	<50.0	3.00	3.00	5,000.00
SB-5	18 – 20'	917.0	379.00	1,296.00	5,000.00
	28 – 30'	<50.0	2.72	2.72	5,000.00
SB-6	8 – 10'	1,110.0	323.00	1,433.00	5,000.00
	18 – 20'	189.0	225.00	414.00	5,000.00
SB-7	18 – 20'	408.0	305.00	713.00	5,000.00
	48 – 50"	<50.0	7.74	7.74	5,000.00
SB-8	3 – 5'	261.0	8.89	269.89	5,000.00
	13 – 15'	<50.0	3.36	3.36	5,000.00
SB-9	18 – 20'	1,550.0	245.00	1,795.00	5,000.00
	38 – 40'	<50.0	3.92	3.92	5,000.00

As Table 1 demonstrates, TPH concentrations in soil samples obtained from borings SB-1 through SB-9 ranged from below the detection limit of 50 ppm DRO and 1 ppm GRO to a maximum combined (DRO and GRO) TPH of 1,795 ppm; far lower than the NMOCD not to exceed value of 5,000 ppm.

Because the 18 – 20' sample from soil boring SB-5 exhibited the highest GRO range TPH, that sample was also analyzed for volatile organic compounds to determine the benzene, toluene, ethylbenzene and xylenes (BTEX) concentration. Laboratory analytical results for the BTEX constituents of the analysis are presented in Table 2, below:

Table 2
BTEX Concentrations; Soil Boring SB-5
BLM 16" Pipeline Release
Lea County, New Mexico

Boring No.	Depth	Benzene (ppm)	NMOCD Maximum Benzene (ppm)	Toluene (ppm)	Ethyl-benzene (ppm)	Total Xylenes (ppm)	Total BTEX (ppm)	NMOCD Maximum BTEX (ppm)
SB-5	18 – 20'	<0.100	10.000	0.111	2.800	11.550	14.461	50.000

As Table 2 illustrates, both benzene and total BTEX concentrations were below the NMOCD ranking criteria of 10 ppm and 50 ppm, respectively.

Conclusions

The results of this investigation have demonstrated that intrinsic bioremediation has reduced the TPH concentrations previously observed in the onsite soils to levels below the NMOCD ranking criteria maximum permissible level of 5,000 ppm. Benzene and total BTEX concentrations are, likewise, below the NMOCD maximum of 10 ppm and 50 ppm, respectively.

Since TPH, benzene, and BTEX concentrations are below the NMOCD Remediation Action Levels, the site qualifies for closure under the existing regulations.

Enercon appreciates this opportunity to provide you our professional environmental consulting services. If you have any questions or comments, please call me at (972) 484-3854.

Sincerely yours,
Enercon Services, Inc.

Don R. Parsons, Jr., C.P.G.
Senior Project Manager

Enclosed are the Analytical Results and Quality Control Data Reports for the following samples submitted to Trace-Analysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received
187011	SB-5 (18-20')	Soil	12/7/01	:	12/12/01
187019	SB-9 (18-20')	Soil	12/7/01	:	12/12/01

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

This report consists of a total of 8 pages and shall not be reproduced except in its entirety including the chain of custody (COC), without written approval of TraceAnalysis, Inc.

Dr. Blair Leftwich, Director

Analytical and Quality Control Report

Kyle Landreneau
Equilon Kyle Landreneau
PMB 284 40 FM 1960 West
Houston, TX 77090

Report Date: December 18, 2001

Order ID Number: A01121224

Project: ES-934
TA Job Code: BlM Historical 16 Pipeline Release
Casualty Code: ES-934
Project Location: Lea County, New Mexico
Enercon Services Inc. / Midland / Jeff Kindley

Enclosed are the Analytical Results and Quality Control Data Reports for the following samples submitted to Trace-Analysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received
187003	SB-1 (3-5')	Soil	12/7/01	:	12/12/01
187004	SB-1 (13-15')	Soil	12/7/01	:	12/12/01
187005	SB-2 (3-5')	Soil	12/7/01	:	12/12/01
187006	SB-2 (13-15')	Soil	12/7/01	:	12/12/01
187007	SB-3 (8-10')	Soil	12/7/01	:	12/12/01
187008	SB-3 913-15')	Soil	12/7/01	:	12/12/01
187009	SB-4 (3-5')	Soil	12/7/01	:	12/12/01
187010	SB-4 (13-15')	Soil	12/7/01	:	12/12/01
187011	SB-5 (18-20')	Soil	12/7/01	:	12/12/01
187012	SB-5 (28-30')	Soil	12/7/01	:	12/12/01
187013	SB-6 (8-10')	Soil	12/7/01	:	12/12/01
187014	SB-6 (18-20')	Soil	12/7/01	:	12/12/01
187015	SB-7 (18-20')	Soil	12/7/01	:	12/12/01
187016	SB-7 (48-50')	Soil	12/7/01	:	12/12/01
187017	SB-8 (3-5')	Soil	12/7/01	:	12/12/01
187018	SB-8 (13-15')	Soil	12/7/01	:	12/12/01
187019	SB-9 (18-20')	Soil	12/7/01	:	12/12/01
187020	SB-9 (38-40')	Soil	12/7/01	:	12/12/01

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

Dr. Blair Leftwich, Director

Re: Subsurface Investigation
Texas-New Mexico Pipe Line Company
16" Historical Release
Lea County, New Mexico
KEI Job No. 610100

Dear Mr. Gripp:

New Mexico Oil Conservation Division (NMOCD) Environmental Bureau in Santa Fe, NM has delegated the regulatory oversight for the above referenced site back to the NMOCD Disrtict I office in Hobbs, NM. The primary reason for this is the work load of the Environmental Bureau and the fact that groundwater has not been impacted.

As of this date the NMOCD is in receipt of KEI's July 23, 1997 report. Please provide to the NMOCD District I office the latest findings of the additional investigation and a proposed work plan with time schedule for the remediation and restoration of the site.

Please provide this information within 30 days of receipt of this letter.

If you require any further information or assistance please do not hesitate to call (505-393-6161) or write this office.

Sincerely Yours,

Wayne Price-Environmental Engineer
