Introduction

This report documents the remediation activities conducted at the STATE A 29 #7, API# 30-025-22934. On behalf of Texland Petroleum-Hobbs, LLC (Texland), Diamondback Disposal Services, Inc. (Diamondback) undertook the cleanup (remediation) and reclamation of release number nAPP2429542850. The release was caused by equipment failure at a coupling, resulting in the discharge of 609 barrels (BBL) of produced water. Of the total discharged, 280 BBL were successfully recovered, leaving 329 BBL unrecovered and necessitating remediation. The site is located in Unit Letter I, Section 29, Township 18S, Range 38E, at coordinates 32.713386, -103.17214. Remediation and reclamation activities were carried out in accordance with the New Mexico Oil Conservation Division (NMOCD) and regulations 19.15.29 and 19.2.100.67 of the New Mexico Administrative Code (NMAC), effective August 14, 2018.

The site is located approximately 0.3 miles west of Hobbs, NM, within a designated oil and gas operations area and adjacent to residential properties. Background information was collected for the site, and a web soil survey (see Appendix A) identified the native soil as Kimbrough loam. Operations took place in an open pasture, and reseeded was necessary. A certified weed-free seed mix was utilized and broadcast at double the recommended rate.

A review by the New Mexico Office of the State Engineer (NMOSE) was conducted to assess groundwater depth within a 1-mile radius of the site and identify registered water wells within a ½-mile radius. Multiple wells were found within the 1-mile radius, with depths to water ranging from 26 to 100 feet below ground surface (BGS). The calculated average depth to water is approximately 54 feet BGS. The nearest well, POD L 13997, is located 466 feet away with a depth to water of 62 feet BGS (see Appendix B for details). The nearest wetland was identified 1934 feet from the site. Karst potential for the site is classified as low. However, due to the proximity of groundwater, municipal boundaries and nearby residences, the most stringent environmental standards were applied. The site was evaluated using the closure criteria outlined in Table 1 of NMAC 19.15.29.12 for groundwater depths of less than 50 feet. (See Table Below)

Table 1 NMAC 19.15.29.12 Closure Criteria for Soils Impacted by a Release		
<50 Feet	Chloride	600 mg/kg
	TPH (GRO+DRO+MRO)	100 mg/kg
	BTEX	50 mg/kg
	Benzene	10 mg/kg

Remediation/Reclamation Activities

Between November 19th, 2024, and January 11th, 2025, Diamondback excavated approximately 4,420 cubic yards (cy) of impacted material. The material was temporarily stockpiled in a designated area at the site before being loaded onto 20-yard trucks and transported to the Lea Land LLC Landfill for final disposal. During this period, field tests were conducted to measure chloride levels and TPH values.

The NMOCD was notified of the intent to begin confirmation sampling of the excavation on November 20th, 2024, December 16th, 2024, January 5th, 2025, and January 10th, 2025. Following these notifications, on the respective dates specified, the site was sampled to determine compliance with the RRALs. Five-point composite samples were collected from every 200 square feet of sidewall and floor area. These samples were packaged and delivered to a third-party laboratory under a chain of custody for analysis per regulatory standards. Upon review of the analytical results, many floor samples (see Appendix C) exceeded the closure criteria. Additional excavation and sampling were conducted in the areas that failed to meet the RRALs. This process was repeated until all floor and wall samples met the Table 1 RRALs required for site closure. Based on the laboratory data, all restoration and reclamation limits have been successfully met for groundwater depths of less than 50 feet BGS.

Beginning on January 31st, 2025, and continuing through February 4th, 2025, backfill was hauled in from a nearby material pit. The lower portion of the excavation was filled to one foot below ground surface with clean, uncontaminated caliche, and the top foot was capped with clean, locally sourced topsoil. Approximately 3,420 cubic yards of locally sourced material was used for backfilling. The material was carefully placed and contoured to match pre-disturbance conditions while ensuring proper

drainage and preventing stormwater runoff. On February 5th, 2025, a certified weed-free seed mix was broadcast at double the recommended PLS per acre (see Appendix D: Site Photography).

The site will be monitored at least semi-annually to determine if substantial vegetative growth has been achieved. Amendments will be applied as necessary until 70% of pre-disturbance conditions have been reached, at which point a final request for reclamation closure will be submitted. These activities will help minimize erosion and maintain consistency with existing site conditions.

Conclusion

Based on the final review of all analytical data provided by the third-party independent laboratory, remediation and reclamation activities at STATE A 29 #7, API #30-025-22934, have successfully met all applicable regulatory requirements. Excavation, sampling, and backfilling efforts were conducted in accordance with NMAC 19.15.29.12 closure criteria, ensuring compliance with the most stringent environmental standards due to the site's proximity to groundwater, municipal boundaries, and residential properties.

All impacted material was removed and properly disposed of, and verification sampling confirmed that all sidewall and floor samples met the required restoration and reclamation action levels. The site was then backfilled, contoured, and reseeded using a certified weed-free seed mix at double the recommended rate to promote vegetative recovery. Semi-annual monitoring will continue until vegetation has reached at least 70 percent of pre-disturbance conditions, at which point a formal request for final reclamation closure will be submitted.

Given these findings, Diamondback Disposal Services, on behalf of Texland Petroleum-Hobbs, LLC, respectfully requests that the NMOCD grant closure approval for release number nAPP2429542850. If any additional information is required to complete the approval process, please do not hesitate to reach out.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Custom Soil Resource Report

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

QUESTIONS

Nature and Volume of Release (continued)	
Is this a gas only submission (i.e. only significant Mcf values reported)	No, according to supplied volumes this does not appear to be a "gas only" report.
Was this a major release as defined by Subsection A of 19.15.29.7 NMAC	Yes
Reasons why this would be considered a submission for a notification of a major release	From paragraph A. "Major release" determine using: (1) an unauthorized release of a volume, excluding gases, of 25 barrels or more.
With the implementation of the 19.15.27 NMAC (05/25/2021), venting and/or flaring of natural gas (i.e. gas only) are to be submitted on the C-129 form.	

Initial Response

The responsible party must undertake the following actions immediately unless they could create a safety hazard that would result in injury.

The source of the release has been stopped	True
The impacted area has been secured to protect human health and the environment	True
Released materials have been contained via the use of berms or dikes, absorbent pads, or other containment devices	True
All free liquids and recoverable materials have been removed and managed appropriately	True
If all the actions described above have not been undertaken, explain why	Not answered.

Per Paragraph (4) of Subsection B of 19.15.29.8 NMAC the responsible party may commence remediation immediately after discovery of a release. If remediation has begun, please prepare and attach a narrative of actions to date in the follow-up C-141 submission. If remedial efforts have been successfully completed or if the release occurred within a lined containment area (see Subparagraph (a) of Paragraph (5) of Subsection A of 19.15.29.11 NMAC), please prepare and attach all information needed for closure evaluation in the follow-up C-141 submission.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.
