The MIT was conducted on Tuesday, February 9, 2021 at 1:30 pm (MT). No NMOC representatives were on site due to State Covid-19 guidelines. A Bradenhead Test (BHT) was also performed; below is a step-by-step summary with results:

- The annular space pressure between the production casing and tubing was 119 psi at the casing valve prior to the start of the MIT; treated acid gas (TAG) was not being injected, but the tubing pressure was 1,706 psi.
- A line from the diesel pump truck was attached to the well head valve, with a separate line to a chart recorder, calibrated on 1/4/21. The annular space pressure was bled to 0 psi prior to placing the pen onto the chart.
- At 1:52 pm, diesel from the pump truck was added to the annular space which increased the pressure to 615 psi.
- At 1:56 pm the chart recorder and well were isolated from the pump truck and the MIT began.
- At 2:28 pm (32 minutes) the annular space pressure was 575 psi; a decrease of 40 psi or 6.5%.
- Diesel was then bled from the annular space into the truck to 0 psi and the chart was removed from the recorder. An operating pressure of 375 psi was left on the annular space prior to disconnection from the truck.

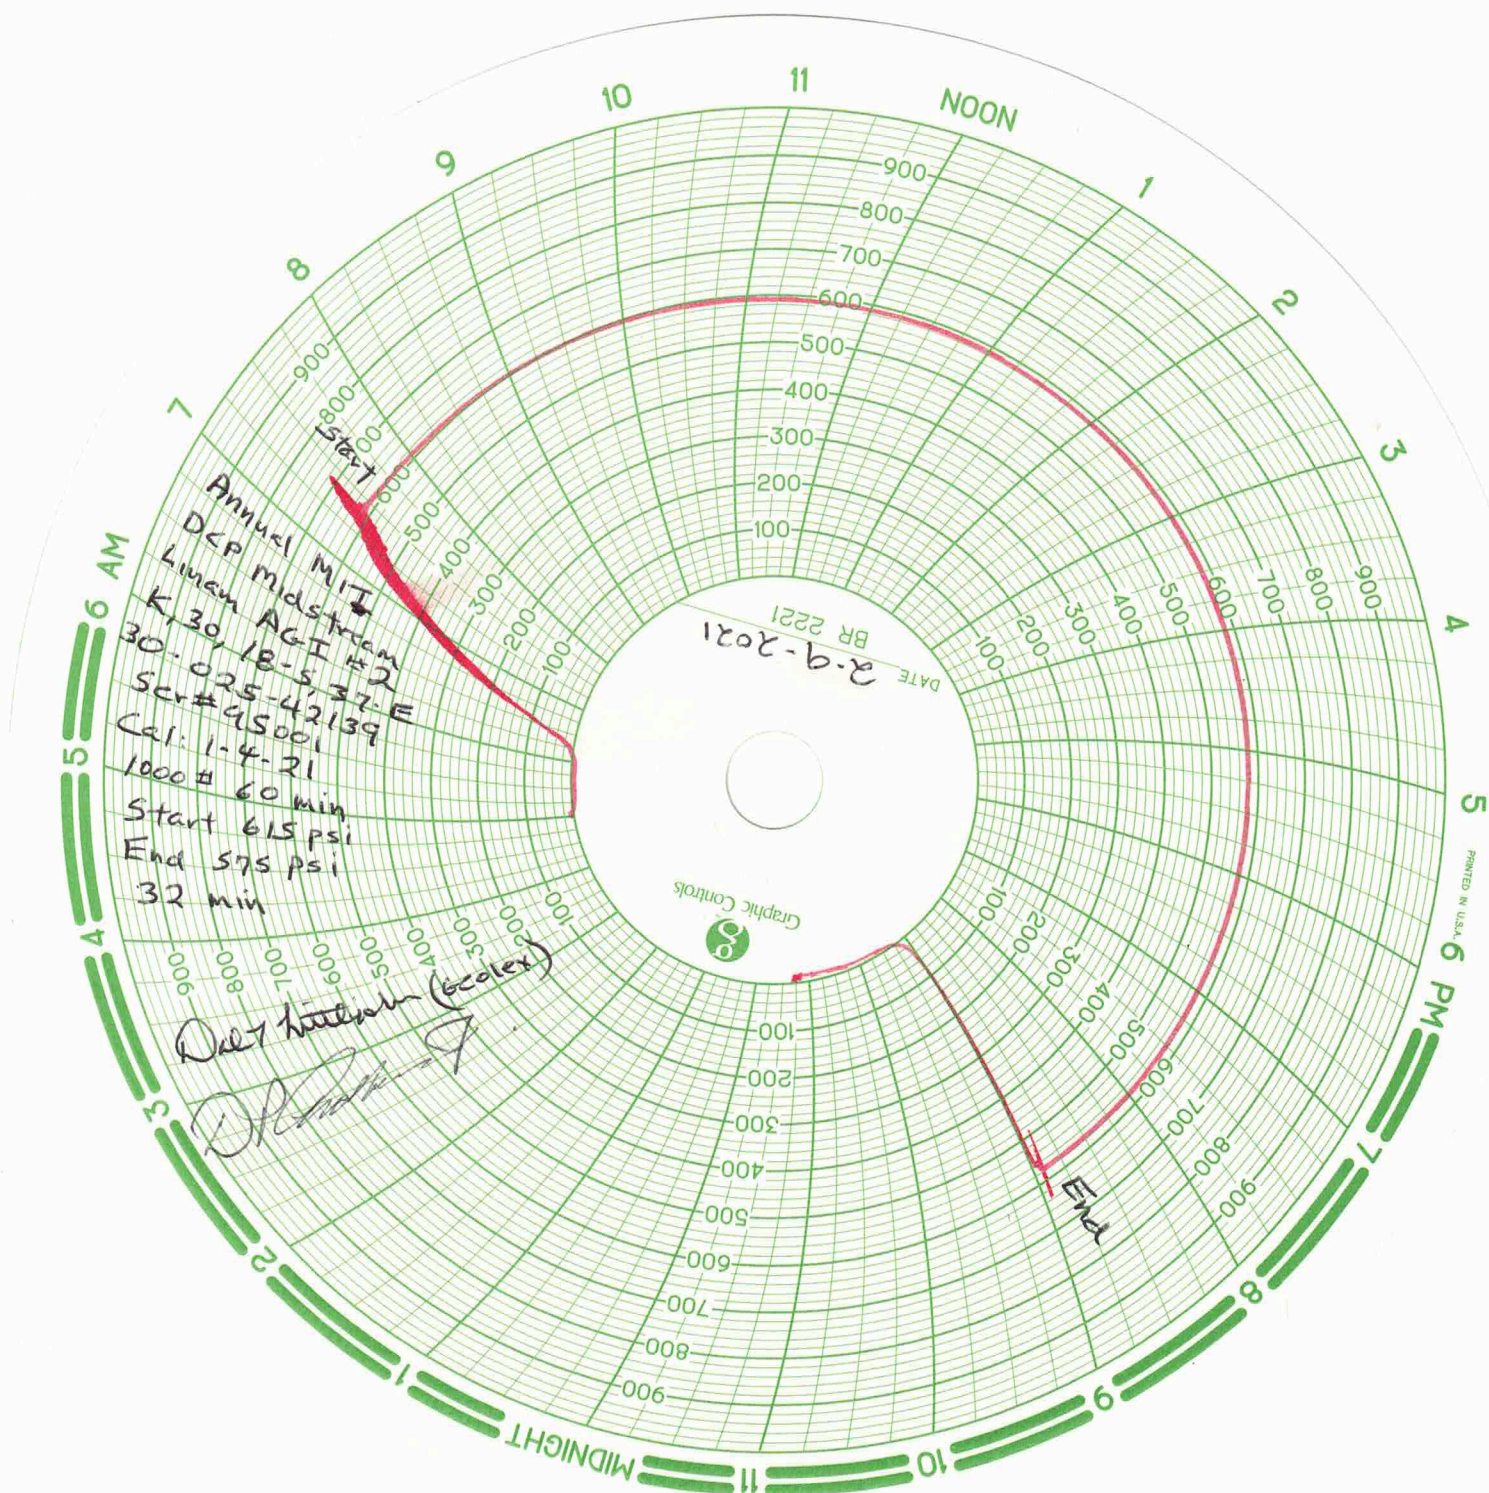

In addition to the MIT, a BHT was conducted by monitoring the intermediate and surface casing annular space pressures during the MIT. The MIT pressure chart, BHT documentation, and chart recorder calibration sheet are attached.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.
