Date proposed operation will begin: 06/30/2021	

Procedure Description: Dugan Production intends to perforate and complete the well in the Fruitland Coal formation, approximately 994'-1012' w/4 spf, 72 holes total. We plan to put the well on artificial lift and put well on production after perforating by means of a sucker rod pump. If hydraulic fracturing is found necessary, we will frac the well with 80,000 gals 70Q foam gel and 72,000 lbs sand. We will also pressure test the casing to 3000 psi to ensure mechanical integrity of the casing before perforating. We also plan to run a Correlated Gamma Ray Spectrum log to determine the tops. A Reservoir Saturation log was run in 2009. A CBL log was also run to verify cement to surface. Both existing logs are on file w/NMOCD. There won't be any new surface disturbance associated with this work. All wireline & hydraulic fracturing equipment will use the existing well pad and access roads. No workover pits are necessary for this work. If needed, a 150 bbl laydown steel half-pit will be used to collect any fluids during the completion procedure and taken to an approved commercial land farm. The planned work start date is immediately after the regulatory approval. Expected completion date for the work is September 2021.

Surface Disturbance

Is any additional surface disturbance proposed?: No
