IV. This is not a horizontal or vertical expansion of an existing injection project. The case file for the unit approval (R-12981) includes a discussion of the water flood. There have been 19 subsequent WFX approvals.

V. Exhibit B shows and tabulates all 46 existing wells (33 oil wells + 6 P&A wells + 6 water injectors + 1 water supply well) within a half-mile radius, regardless of depth. Exhibit C shows all 539 existing wells (390 oil or gas wells + 68 injection or disposal wells + 68 P & A wells + 13 water supply wells) within a two-mile radius.

Exhibit D shows all leases (only BLM and fee) within a half-mile radius. Exhibit E shows all lessors (BLM, fee, and state) within a two-mile radius. Details on the leases within a half-mile are:

VI. Forty-six existing wells are within a half-mile radius. Thirty of the wells penetrated the Blinebry (5726'). The penetrators include 20 oil wells, 6 water injectors, 3 P&A wells, and 1 water supply well (plugged back from the Drinkard to the San Andres). A table abstracting the well construction details and histories of the penetrators is in Exhibit F. Diagrams of the P&A wells are also in Exhibit F.

- VII. 1. Average injection rate will be \approx 2500 bwpd.
Maximum injection rate will be 3000 bwpd.
2. System will be closed. The well will tie into the existing Unit pipeline system. It consists of a branched injection system with centrifugal injection pumps.
3. Average injection pressure will be \approx 1100 psi. Maximum injection pressure will be 1120 psi (see item (13) of Order R-12981).
4. Water source will be water pumped from two existing \approx 4000' deep San Andres water supply wells, plus produced water from Blinebry, Tubb, and Drinkard zones. The source water and produced water are collected in separate skim tanks. The two water streams (source and produced) are commingled in a tank before being piped to the injection wells. A comparison of nearby analyses and San Andres follows. No compatibility problems have reported from the 47,270,878 barrels that have been injected in the unit to date.

5. There are 118 active or new oil wells in the Unit. It is the goal of the project to increase production.

VIII. The Unit is on the north end of a north-northwest to south-southeast trending anticline. It is part of the Penrose Skelly trend and parallels the west edge of the Central Basin Platform. Dips are 1° to 2°. The injection interval is Leonardian in age, 1090' thick, and consists of tan to dark gray shallow marine carbonates, many of which have been dolomitized. Core filling and replacement anhydrite are common in the limestone. Nodular anhydrite is common in the dolomite. Five per cent porosity cut off is used to determine pay zones. Impermeable shale and carbonates vertically confine the interval.

There are currently 106 Blinebry injectors, 124 Tubb injectors, and 152 Drinkard injectors in the state. The West Blinebry Drinkard Unit shares its east border with Apache's Northeast Drinkard Unit. Three other similar water floods (East Blinebry Drinkard Units, Central Drinkard Unit, and Warren Blinebry Unit) are

within a mile of the West Blinebry Drinkard Unit. The Central Drinkard Unit has been under water flood since the 1960s.

Formation depths are:

Seven Rivers = 2918'
Queen = 3451'

Injection interval = 5726' - 6825'
Tubb = 6209'
Drinkard = 6554'
Abo = 6831'
TD = 6953'

Office of the State Engineer records (Exhibit G) show one fresh water well (CP 01026 PD1) is within a mile radius. It, and a second well (CP 00447/00448) 1.26 miles southwest, were sampled on May 19, 2017. The Ogallala is 1.6 miles northeast.

Deepest water well within a 2-mile radius is 220'. No existing underground drinking water sources are below the injection interval within a 2-mile radius.

There will be >5,000' of vertical separation and hundreds of feet of salt and anhydrite between the bottom of the only likely underground fresh water source and the top of the injection interval.

Produced water is currently being injected (208 wells) or disposed (8 wells) into the Blinebry-Tubb-Drinkard, San Andres, Grayburg, Queen, Seven Rivers, and Yates within T. 21 S., R. 37 E.

- X. A CBL/GR/CCL log was run and submitted to NMOCD.
- XI. One fresh water well is within a mile. Analyses from it and a second well just beyond a mile are in Exhibit G.
- XII. Apache is not aware of any geologic or engineering data that may indicate the injection interval is in hydrologic connection with any underground sources of water. Closest Quaternary faults are \approx 109 miles southwest (Exhibit H). There are currently 106 Blinebry injectors, 124 Tubb injectors, and 152 Drinkard injectors in the state. Previously approved water flood expansions (WFX-) in the Unit include 854, 857, 913, 921, 922, 923, 924, 948, 952, 954, 955, 958, 959, 960, 962, 964, 965, 967, and 968.

Brian,

As per Mark's comments below, our G&G staff has taken a look at the potential issue of shallow faulting in the WBDU area and have concluded there is none present across the area and no danger of shallow faulting as a conduit to groundwater contamination.

Subject: shallow faulting in the vicinity of WBDU

Martin:

In reference to the meeting this morning where we discussed the possibility of shallow faulting in the WBDU area and its potential impact on the permitting of the injection well(s) into the Drinkard, I submit to you the attached slide set from me and Justin. You will see that we have done several extractions on the seismic data and there is no indication of faulting above the Glorieta which is well above the Drinkard and below the younger evaporites. Also, as we suspected, there are no surface faults mapped in the area – the nearest being more than 50 miles away.

Please contact me or Justin if you have further questions.

Sincerely,
