STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION

APPLICATION OF WATERBRIDGE STATELINE LLC
TO APPROVE SALT WATER DISPOSAL
WELL IN LEA COUNTY, NEW MEXICO.

CASE NO. 24570
(FPNM SWD #6)

AFFIDAVIT OF OLIVER SEEKINS

Oliver Seekins, of lawful age and being duly sworn, declares as follows:

1. My name is Oliver Seekins. I work for ALL Consulting as a Project Manager/Regulatory Specialist. I have been retained by WaterBridge Stateline LLC (“WaterBridge”) (OGRID No. 330129).

2. I personal knowledge of the matters stated herein.

3. I have previously testified before the Oil Conservation Division (“Division”) as an expert witness in regulatory matters and permitting salt water disposal wells. My credentials as an expert in regulatory matters and permitting salt water disposal wells have been accepted by the Division and made a matter of record.

4. My area of responsibility includes the area of Lea County in New Mexico.

5. I am familiar with the application WaterBridge filed in this matter and I am familiar with the status of the lands in the subject area.

6. **Exhibit A-1** is the hearing application in Case No. 24570 that WaterBridge filed with the Division. The application includes the Form C-108, attached as Exhibit A to the Application. In preparing for this hearing, I have reviewed the C-108 and did not identify any changes that require amending the C-108 or affect the accuracy of statements in the C-108.

7. In this case, WaterBridge seeks authorization to inject produced water into the Glorieta Sandstone formation through the FPNM SWD #6 well at a surface location 1964' from the North line and 2170' from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico.

8. WaterBridge seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet.

9. WaterBridge requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day.

10. The well will be a commercial well, and WaterBridge intends to commence drilling the Well as soon as reasonably possible after receiving the injection order and commence injection within 1-year of receiving the approved injection order or an approved NMOCD authorization to inject extension.

11. Attachment 2 in Exhibit A-1 include a map that identifies wells within 2 miles of the Well.

12. As noted in Attachment 2, there are no wells within a half-mile of the Well.

13. Attachment 2 identifies the operators, lessees, mineral and surface owners within two miles of the Well.

14. I also reviewed whether there are any fresh water wells within a mile of the Well. There is one well within one mile of the Well, however according to NMOSE records, this well in not currently active, and as such is unavailable for sampling , as noted in Attachment 6 to Exhibit A-1.

15. I provided notice information to WaterBridge's counsel based on OCD's regulations, in Rule 19.15.26.8(B), which require notice to the surface owner and to each leasehold

operator, and to any other affected person as that term is defined Rule 19.15.2.7(8). The notice party information is included in Attachment 9 to Exhibit A-1.

16. It is my opinion that WaterBridge undertook a good faith effort to locate and identify the correct parties and valid addresses required for notice.

17. In my opinion, the granting of WaterBridge's application is in the interests of conservation and the prevention of waste. The Well will provide much needed capacity for produced water, which will, in turn, support oil and gas operators' ability to produce oil and gas.

18. The attached exhibits were prepared by me, or compiled from company business records, or were prepared at my direction.

19. I attest under penalty of perjury under the laws of the State of New Mexico that the information provided herein is correct and complete to the best of my knowledge and belief.

APPLICATION OF WATERBRIDGE STATELINE LLC
TO APPROVE SALT WATER DISPOSAL
WELL IN LEA COUNTY, NEW MEXICO.

CASE NO. 24570

APPLICATION

WaterBridge Stateline LLC ("WaterBridge"), OGRID No. 330129, through its undersigned attorneys, hereby submits this application to the Oil Conservation Division pursuant to the provisions of NMSA 1978, § 70-2-12, Rule No. 19.15.26, and Rule 19.15.4.8 for an order approving drilling of a salt water disposal well in Lea County, New Mexico. In support of this application, WaterBridge states as follows:

(1) WaterBridge proposes to drill the FPNM SWD #6 well at a surface location 1,964' from the North line and 2,170' from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well.

(2) WaterBridge seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet.

(3) WaterBridge requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day.

(4) WaterBridge requests approval of a maximum injection pressure of 1,080 psi for the well.

(5) A proposed C-108 for the subject well is attached hereto as Attachment A.

(6) The granting of this application will avoid the drilling of unnecessary wells, will prevent waste, and will protect correlative rights.

WHEREFORE, WaterBridge requests that this application be set for hearing before an Examiner of the Oil Conservation Division on June 13, 2024; and that after notice and hearing, the Division enter its order approving this application.

Respectfully submitted,

MODRALL, SPERLING, ROEHL, HARRIS
& SISK, P.A.

Attorneys for Applicant

CASE NO. 24570: Application of WaterBridge Stateline LLC for approval of a salt water disposal well in Lea County, New Mexico. Applicant seeks an order approving disposal into the Glorieta Sandstone formation through the FPNM SWD #6 well at a surface location 1,964' from the North line and 2,170' from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well. Applicant seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet. Applicant further requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day. Said area is located approximately 7.94 miles Southeast of Jal, New Mexico.

ADMINISTRATIVE APPLICATION CHECKLIST

THIS CHECKLIST IS MANDATORY FOR ALL ADMINISTRATIVE APPLICATIONS FOR EXCEPTIONS TO DIVISION RULES AND REGULATIONS WHICH REQUIRE PROCESSING AT THE DIVISION LEVEL IN SANTA FE

Applicant: WaterBridge Stateline LLC **OGRID Number:** 330129
Well Name: FPNM SWD #6 **API:** _____
Pool: SWD; Glorieta **Pool Code:** 96106

SUBMIT ACCURATE AND COMPLETE INFORMATION REQUIRED TO PROCESS THE TYPE OF APPLICATION INDICATED BELOW

- 1) **TYPE OF APPLICATION:** Check those which apply for [A]
 A. Location – Spacing Unit – Simultaneous Dedication
 NSL NSP (PROJECT AREA) NSP (PRORATION UNIT) SD
- B. Check one only for [I] or [II]
 [I] Commingling – Storage – Measurement
 DHC CTB PLC PC OLS OLM
 [II] Injection – Disposal – Pressure Increase – Enhanced Oil Recovery
 WFX PMX SWD IPI EOR PPR

- 2) **NOTIFICATION REQUIRED TO:** Check those which apply.
 A. Offset operators or lease holders
 B. Royalty, overriding royalty owners, revenue owners
 C. Application requires published notice
 D. Notification and/or concurrent approval by SLO
 E. Notification and/or concurrent approval by BLM
 F. Surface owner
 G. For all of the above, proof of notification or publication is attached, and/or,
 H. No notice required

FOR OCD ONLY
<input type="checkbox"/> Notice Complete
<input type="checkbox"/> Application Content Complete

3) **CERTIFICATION:** I hereby certify that the information submitted with this application for administrative approval is **accurate** and **complete** to the best of my knowledge. I also understand that **no action** will be taken on this application until the required information and notifications are submitted to the Division.

Note: Statement must be completed by an individual with managerial and/or supervisory capacity.

STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL
RESOURCES DEPARTMENT

Oil Conservation Division
1220 South St. Francis Dr.
Santa Fe, New Mexico 87505

FORM C-108
Revised June 10, 2003

APPLICATION FOR AUTHORIZATION TO INJECT

I. PURPOSE: _____ Secondary Recovery _____ Pressure Maintenance X Disposal _____ Storage
Application qualifies for administrative approval? X Yes _____ No

II. OPERATOR: WaterBridge Stateline LLC

ADDRESS: 5555 San Felipe, Ste. 1200 Houston, TX 77056

CONTACT PARTY: Jessica High - Director, QHSE & Regulatory PHONE: 832-871-4064

III. WELL DATA: Complete the data required on the reverse side of this form for each well proposed for injection.
Additional sheets may be attached if necessary.

IV. Is this an expansion of an existing project? _____ Yes X No
If yes, give the Division order number authorizing the project: _____

V. Attach a map that identifies all wells and leases within two miles of any proposed injection well with a one-half mile radius circle drawn around each proposed injection well. This circle identifies the well's area of review.

VI. Attach a tabulation of data on all wells of public record within the area of review which penetrate the proposed injection zone. Such data shall include a description of each well's type, construction, date drilled, location, depth, record of completion, and a schematic of any plugged well illustrating all plugging detail.

VII. Attach data on the proposed operation, including:
1. Proposed average and maximum daily rate and volume of fluids to be injected;
2. Whether the system is open or closed;
3. Proposed average and maximum injection pressure;
4. Sources and an appropriate analysis of injection fluid and compatibility with the receiving formation if other than reinjected produced water; and,
5. If injection is for disposal purposes into a zone not productive of oil or gas at or within one mile of the proposed well, attach a chemical analysis of the disposal zone formation water (may be measured or inferred from existing literature, studies, nearby wells, etc.).

*VIII. Attach appropriate geologic data on the injection zone including appropriate lithologic detail, geologic name, thickness, and depth. Give the geologic name, and depth to bottom of all underground sources of drinking water (aquifers containing waters with total dissolved solids concentrations of 10,000 mg/l or less) overlying the proposed injection zone as well as any such sources known to be immediately underlying the injection interval.

IX. Describe the proposed stimulation program, if any.

*X. Attach appropriate logging and test data on the well. (If well logs have been filed with the Division, they need not be resubmitted).

*XI. Attach a chemical analysis of fresh water from two or more fresh water wells (if available and producing) within one mile of any injection or disposal well showing location of wells and dates samples were taken.

XII. Applicants for disposal wells must make an affirmative statement that they have examined available geologic and engineering data and find no evidence of open faults or any other hydrologic connection between the disposal zone and any underground sources of drinking water.

XIII. Applicants must complete the "Proof of Notice" section on the reverse side of this form.

XIV. Certification: I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

NAME: Oliver Seekins TITLE: Project Manager / Regulatory Specialist

SIGNATURE:  DATE: 5/13/2024

E-MAIL ADDRESS: oseekins@all-llc.com

* If the information required under Sections VI, VIII, X, and XI above has been previously submitted, it need not be resubmitted. Please show the date and circumstances of the earlier submittal: _____

DISTRIBUTION: Original and one copy to Santa Fe with one copy to the appropriate District Office

Application for Authorization to Inject
 Well Name: FPNM SWD #6

III – Well Data (The wellbore diagram is included as **Attachment 1**)

A.

(1) General Well Information:

Operator: WaterBridge Stateline LLC (OGRID No. 330129)
 Lease Name & Well Number: FPNM SWD #6
 Location Footage Calls: 1,964' FNL & 2,170' FWL
 Legal Location: UL F, S17 T26S R38E
 Ground Elevation: 2,983'
 Proposed Injection Interval: 5,400' - 5,775'
 County: Lea

(2) Casing Information:

Type	Hole Size	Casing Size	Casing Weight	Setting Depth	Sacks of Cement	Estimated TOC	Method Determined
Surface	24"	20"	94.0 lb/ft	1,165'	1,185	Surface	Circulation
Intermediate 1	17-1/2"	13-3/8"	54.5 lb/ft	2,635'	1,940	Surface	Circulation
Production Casing	12-1/4"	9-5/8"	40.0 lb/ft	5,775'	1,915	Surface	CBL
Tubing	N/A	5-1/2"	17.0 lb/ft	5,375'	N/A	N/A	N/A

DV Tool set at: 3,000'

(3) Tubing Information:

5-1/2" (17.0 lb/ft) ceramic-coated tubing with setting depth of 5,375'

(4) Packer Information: ACT AS1-X or equivalent packer set at 5,375'

B.

(1) Injection Formation Name: Glorieta Sandstone

Pool Name: SWD;Glorieta

Pool Code: 96106

(2) Injection Interval: Perforated injection between 5,400' - 5,775'

(3) Drilling Purpose: New drill for saltwater disposal

(4) Other Perforated Intervals: No other perforated intervals exist.

(5) Overlying Oil and Gas Zones: Below are the approximate formation tops for known oil and gas producing zones in the area.

- Yates (2,815')
- Seven Rivers (2,889')
- Queen (3,424')
- Penrose (3,730')

Underlying Oil and Gas Zones: Below are the approximate formation tops for known oil and gas producing zones in the area.

- Tubb (6,630')
- Devonian (9,098')

V – Well and Lease Details

The following maps and documents are included as **Attachment 2**:

- 2-mile Oil & Gas Well Map
- ½-mile AOR Well Table
- 2-Mile Lease Map
- 2-Mile Mineral Ownership Map
- 2-Mile Surface Ownership Map
- Potash Lease Map

VI – AOR Well List

A list of the well(s) within the 1/2-mile AOR is included in **Attachment 2**.

There are no wells in the ½-mile AOR.

VII – Proposed Operation

- (1) **Proposed Maximum Injection Rate:** 20,000 bpd
Proposed Average Injection Rate: 15,000 bpd
- (2) A **closed-loop system** will be used.
- (3) **Proposed Maximum Injection Pressure:** 1,080 psi (surface)
Proposed Average Injection Pressure: Approximately 810 psi (surface)
- (4) **Source Water Analysis:** The expected injectate will consist of produced water from production wells completed in the Queen, Wolfcamp, Devonian and Ellenburger formations. Analysis of water from these formations is included as **Attachment 3**.
- (5) **Injection Formation Water Analysis:** The proposed SWD will be injecting water into the Glorieta Sandstone, which is a non-productive zone known to be compatible with formation water from the Queen, Wolfcamp, Devonian and Ellenburger formations. Water analyses from the Glorieta Sandstone in the area are included as **Attachment 4**.

VIII – Geologic Description

The proposed injection interval includes the Glorieta Sandstone from 5,400' - 5,775'. The Permian-aged Glorieta Sandstone is a fine grained and well-to-moderately sorted quartz arenite sandstone that occurs directly below the San Andres Formation. There are multiple zones of high porosity and low resistivity that makes this sandstone a viable injection zone in this area.

Further discussion of the injection formation, overlying and underlying confinement zones, and historic use of the field are included as **Attachment 5**.

The base of the USDW is the Rustler Formation at a depth of approximately 1,140 feet. Depth of the nearest water well in the area is approximately 185 feet below ground surface.

IX – Proposed Stimulation Program

A small cleanup acid job may be used to remove mud and drill cuttings from the formation. However, no other formation stimulation is currently planned.

X – Logging and Test Data

Logs will be submitted to the Division upon completion of the well.

XI – Fresh Groundwater Samples

Based on a review of data from the New Mexico Office of the State Engineer, there is one (1) groundwater well located within 1-mile of the proposed SWD location. However, the well is not eligible for sampling because of its location in an area with aquifer production restrictions.

A water well map and details of the water well within 1-mile are included as **Attachment 6**.

XII – No Hydrologic Connection Statement

No publicly known faulting is present in the area that would provide a hydrologic connection between the injection interval and overlying USDWs. Additionally, the casing program has been designed to ensure there will be no hydrologic connection between the injection interval and overlying USDWs.

A signed *No Hydrologic Connection Statement* is included as **Attachment 7**.

In addition, a *Seismic Potential Letter* detailing the minimal risk of injection-induced seismicity associated with the proposed SWD is included as **Attachment 8**.

XIII – Proof of Notice

A public notice will be filed with the Hobbs News Sun newspaper, and an affidavit will be included as an exhibit at hearing.

A copy of the application will be mailed to the identified affected persons, with delivery confirmation being provided as an exhibit at hearing. A list of the identified affected persons is included as **Attachment 9**.

ASI-X MECHANICAL PACKER

The ACT ASI-X Packer is the most versatile of the mechanically set retrievable packers and may be used in any production application. Treating, testing, injecting, pumping wells, flowing wells, deep or shallow, the ASI-X is suited for all. The packer can be left in tension or compression, depending on well conditions and the required application. A large internal by-pass reduces swabbing when running and retrieving. The by-pass closes when the packer is set and opens prior to releasing the upper slips when retrieving to allow pressure equalization.

The J-slot design allows easy setting and releasing; 14 turn right-hand set, right-hand release. A patented upper-slip releasing system reduces the force required to release the packer. A non-directional slip is released first, making it easier to release the other slips. The ASI-X packer can withstand 7,000 psi (48 MPa) of differential pressure above or below.

FEATURES, ADVANTAGES AND BENEFITS:

- The design holds high differential pressure from above or below, enabling the packer to meet most production, stimulation, and injection needs.
- The packer can be set with compression, tension, or wire line, enabling deployment in shallow and deep applications.
- The packer can be set and released with only a one-quarter turn of the tubing.
- The by-pass valve is below the upper slips so that debris are washed from the slips when the valve is opened, reducing the times for circulation and tool retrieval.

- The full opening enables unrestricted flow and the passage of wire line tools and other packer systems.
- The packer can be run with the T-2 cut-off tool, which enables the tubing to be disconnected and retrieved without retrieving the packer.

OPTIONS:

- Elastomer options are available for hostile environments.
- Optional safety releases are available.

Confining Zones and Historic Pore Space Use

CONFINING ZONES AND HISTORIC PORE SPACE USAGE

For WaterBridge Stateline LLC's proposed FPNM SWD #6 application in the Lower Permian Glorieta Sandstone in the Central Basin Platform area, the lower San Andres Formation will act as the upper confinement zone, and the lower Glorieta Sandstone as the lower confinement zone, given its low porosity and high resistivity. The proposed location is in T26S., R38E, an area with very limited oil and gas production. Most area wells have been plugged and abandoned, and none penetrate the proposed injection intervals in the Glorieta Sandstone.

The San Andres Formation is a shelf carbonate deposit composed predominantly of dolomite, and in the proposed development area, the lower San Andres Formation is a tight rock with low porosity and high resistivity values. **Figure 1** is a log snip of this upper confining zone of approximately 60 feet in the lower San Andres Formation. The lower confining zone is a tight sandstone unit within the Glorieta Sandstone, which also has low porosity development and high resistivity readings. The Glorieta Sandstone is a fine-grained, well-to-moderately sorted quartz arenite sandstone. **Figure 2** is a log snip of this approximately 30 feet of lower Glorieta Sandstone.

The closest oil and gas production to the FPNM SWD #6 is the active waterflood operation directly to the west. This waterflood operation is the W.H. Rhodes B Federal NCT-1 unit project and was originally operated by Texaco, Inc., with the first waterflood injection commencing in 1964 and continued expansion occurring in 1969, 1973, and 1993 by Texaco Exploration and Production, Inc. Oil production and enhanced oil recovery water injection is into the Yates and Seven Rivers formations at depths ranging from approximately 3,000 to 3,400 feet and primarily located in T26S, R37E. There is no oil or gas production from the Glorieta Sandstone within the two-mile radius of the proposed FPNM SWD #6.

No Hydrologic Connection Statement

RE: Waterbridge Stateline LLC – FPNM SWD #6 application, Lea County, New Mexico

ALL Consulting LLC (ALL) has performed a thorough hydrologic investigation related to the one saltwater disposal well (SWD) listed above. The investigation was conducted to determine if there were any existing or potential connections between the proposed injection intervals in the Glorieta Sandstone and the deepest underground source of drinking water (USDW).

ALL performed an assessment and analysis of the subsurface geophysical log data along with published documents on the groundwater in this vicinity of Lea County, New Mexico. The surficial geology is Quaternary alluvial deposits consisting predominantly of sand and caliche. This area is south of the High Plains Aquifer and depths to potable water ranges from 30 to 142 feet below the surface. The USDW is the Rustler Formation and the base of the USDW ranges from 875 to 1,130 feet below the surface.

Based on ALL’s assessment and analysis there is containment through multiple confining zones in the San Andres Formation and the Salado evaporite deposits above the Glorieta Sandstone and the USDW and over 4,260 feet of vertical separation between the base of the USDW and the top of the injection interval. Additionally, there is no evidence of faults that would allow for communication between the USDW and Glorieta Sandstone.

Seismic Potential Letter

March 18, 2024

PN 1703.SWD.13

Mr. Phillip Goetze, P.G.
 NM EMNRD – Oil Conservation Division
 1220 South St. Francis Drive
 Santa Fe, NM 87505

Subject: **WaterBridge Stateline LLC**
FPNM SWD #6 - Seismic Potential Letter

Dear Mr. Goetze,

At the request of WaterBridge Stateline LLC (WaterBridge), ALL Consulting, LLC (ALL) has assessed the potential injection-induced seismicity risks in the vicinity of WaterBridge's FPNM SWD #6, a proposed saltwater disposal (SWD) facility in Lea County, New Mexico, and summarized the findings in this letter. This assessment used publicly available data to identify the proximity and characteristics of seismic events and known faults to evaluate the potential for the operation of the FPNM SWD #6 to contribute to seismic activity in the area.

Geologic Evaluation

The FPNM SWD #6 is requesting a permit to inject into the Permian Glorieta Sandstone (Glorieta) at a depth of 5,400-5,775 feet below ground surface (bgs). The Glorieta primarily consists of Permian-age sandstone and is overlain by approximately 60 feet of low porosity carbonate rocks within the lower San Andres Formation, which would prevent the upward migration of injection fluid and serve as the upper confining layer (see **Attachment 1**). Additionally, approximately 28 feet of low porosity and low permeability other carbonate rocks lie beneath the proposed injection interval and act as a lower confining zone by preventing downward migration of injected fluids into the underlying Tubb Formation (see **Attachment 1**). A stratigraphic chart depicting the geologic setting is included as **Figure 1**.¹

Seismic Events and Fault Data

A review of United States Geological Survey (USGS) and New Mexico Tech Seismological Observatory (NMTSO) earthquake catalogs determined that four (4) seismic events have been recorded within a 100 square mile area [9.08-kilometer (km) radius] around the subject SWD.

¹ Yang, K.-M., & Dorobek, S. L. (1995). The Permian Basin of west Texas and New Mexico: Tectonic history of a "composite" Foreland Basin and its effects on stratigraphic development. *Stratigraphic Evolution of Foreland Basins*, 149–174. <https://doi.org/10.2110/pec.95.52.0149>

WaterBridge Stateline LLC
 FPNM SWD #6 Seismic Information
 March 18, 2024

The closest recorded seismic event was a M1.68 that occurred on July 22, 2017, and was located approximately 0.62 miles southwest of the FPNM SWD #6 (see **Attachment 2**).

Fault data from United States Geological Survey (USGS) and the Texas Bureau of Economic Geology (BEG)² indicates that the closest known fault is located approximately 0.29 miles west of the FPNM SWD #6 (see **Attachment 2**). This identified fault is within the Precambrian basement, which is approximately 8,225 feet below the proposed injection interval.³ Fault data from Sourcewater also indicates the presence of four faults in the sedimentary column, above the Precambrian basement, within the area of review.⁴ These shallow faults penetrate the Canyon, Cisco, and Wolfcamp formations which begin approximately 2,940 feet below the proposed injection interval. As previously discussed, there are confining barriers beneath the proposed injection interval which will prevent the downward migration of fluids into such faults. A map of the seismic events and faults within 9.08 km of the FPNM SWD #6 is included as **Attachment 2**.

Seismic Potential Evaluation

Experience in evaluating induced seismic events indicates that most injection-induced seismicity throughout the U.S. (e.g., Oklahoma, Ohio, Texas, New Mexico, and Colorado) occurs as a result of injection into Precambrian basement rock, into overlying formations that are in hydraulic communication with the Precambrian basement rock, or as a result of injection near critically stressed and optimally oriented faults. Seismicity at basement depths occurs because critically stressed faults generally originate in crystalline basement rock and may also extend into overlying sedimentary formations.⁵

WaterBridge Stateline LLC
 FPNM SWD #6 Seismic Information
 March 18, 2024

Injection into either the Precambrian basement rock or its overlying formations that are hydraulically connected to the basement rock through faulting or fracture networks can increase the pore pressure and may lead to the fault slipping, resulting in a seismic event.⁴ As such, the vertical distance between the injection formation and Precambrian basement rock and the presence or lack of faulting within the injection interval are major considerations when determining the risk of injection-induced seismicity.

Geophysical logs from nearby well records show at least 8,225 feet of vertical separation between the injection interval and the Precambrian basement.³ In addition, injection-induced seismicity is not typically associated with shallow disposal wells in the Central Basin Platform and Delaware Basin areas, such as the FPNM SWD #6.

For injection into the Glorieta Sandstone to contribute to seismic activity, one of two hypothetical geologic scenarios must exist:⁶

1. Scenario #1: Earthquake hypocenters would need to be significantly shallower (several kilometers) than initially identified by the USGS and NMTSO seismic monitoring networks, and thus placing seismic activity high in the sedimentary column, rather than in the Precambrian basement.
2. Scenario #2: This scenario would require that both of the following conditions are met:
 - a. Fault Transmissivity: High permeability and transmissive conduits from fault-damaged zones would need to be present below the Glorieta, allowing fluid to migrate through the underlying Tubb Formation and through significantly deeper confining intervals, and eventually into the Precambrian basement.
 - b. Pore Pressure: The injection fluids and bottom hole pressures in the Glorieta would need to exceed existing hydrostatic pressures within the deeper geologic formation in order for injection fluids to migrate downward.

There are no publications or geologic data that suggest either of these scenarios to be true for the area around the FPNM SWD #6.

Formation Parting Pressure

Class II SWDs in New Mexico are administratively permitted with a maximum pressure gradient of 0.2 psi/ft. Review of New Mexico Oil Conservation Division (OCD) Order IP-476 submitted by Chevron USA Inc. in support of the Vacuum Glorieta West Unit, which is located approximately 60 miles northwest of the FPNM SWD #6, determined the fracture gradient of the Glorieta in the region ranges from 0.26-0.39 psi/ft from approved step-rate tests. Typical SWD permitting standards in New Mexico, and the requested operating parameters of the FPNM SWD #6, would indicate that formation parting pressure would not be exceeded by the FPNM SWD #6.

⁶ Skoumal, Robert J., et al. "Induced Seismicity in the Delaware Basin, Texas." *Journal of Geophysical Research: Solid Earth*, vol. 125, no. 1, 2020, doi:10.1029/2019jb018558.

WaterBridge Stateline LLC
FPNM SWD #6 Seismic Information
March 18, 2024

Conclusion

As an expert on the issue of induced seismicity, seismic monitoring, and mitigation, it is my opinion that the potential for the FPNM SWD #6 to cause injection-induced seismicity is expected to be minimal, at best. This conclusion assumes the FPNM SWD #6 will be operated below formation parting pressure and is based on (1) the presence of numerous confining layers above and below the injection interval, (2) the significant vertical distance between the injection zone and Precambrian basement rock in which the nearest fault has been identified, and (3) the vertical distance from, and lack of historic seismicity on, identified shallow faults in the area of review.

Sincerely,
ALL Consulting, LLC

**APPLICATION OF WATERBRIDGE STATELINE LLC
TO APPROVE SALT WATER DISPOSAL
WELL IN LEA COUNTY, NEW MEXICO.**

**CASE NO. 24570
(FPNM SWD #6)**

AFFIDAVIT OF THOMAS E TOMASTIK

Thomas E. Tomastik, of lawful age and being duly sworn, declares as follows:

1. My name is Thomas E. Tomastik. I work for ALL Consulting as a Chief Geologist and Regulatory Specialist. I have been retained by WaterBridge Stateline LLC (“WaterBridge”) (OGRID No. 330129).

2. I personal knowledge of the matters stated herein.

3. I have previously testified before the Oil Conservation Division (“Division”) as an expert witness in petroleum engineering and petroleum geology and my credentials as have been accepted by the Division and made a matter of record.

4. My area of responsibility includes the area of Lea County in New Mexico.

5. I am familiar with the application WaterBridge filed in this matter and I am familiar with the status of the lands in the subject area.

6. I undertook a hydrologic evaluation related to the proposed FPNM SWD #6 well (the “Well”), which is included as Attachment 7 to Exhibit A-1.

7. WaterBridge seeks authorization to inject produced water into the Glorieta Sandstone at the Well into the Glorieta Sandstone at a depth of approximately 5,400 feet to 5,775 feet.

8. I examined available geologic and engineering data and found no evidence of open faults or any other hydrologic connection between the disposal zone and any underground sources of drinking water (“USDW”).

9. In my opinion, there is containment through multiple confining zones in the San Andres Formation and the Salado evaporite deposits above the Glorieta Sandstone and the USDW and over 4,260 feet of vertical separation between the base of the USDW and the top of the injection interval. Additionally, there is no evidence of faults that would allow for communication between the USDW and Glorieta Sandstone.

10. In addition, WaterBridge’s wellbore design will isolate any known freshwater zones and is protective of USDWs.

11. All of the well data and operations information required by the C-108 is included in the C-108 attached as Exhibit A-1. The proposed well design is contained in Attachment 1 to the C-108 and described in Section III.A of the C-108.

12. In my opinion, the well design will be protective of freshwater and USDWs in the area and protective of correlative rights.

13. A water chemistry analysis is provided as Attachments 3 and 4 to Exhibit A-1. Based on this water chemistry analysis, in my opinion and based on my experience, there will not be a compatibility issue between the injection fluids and the fluids within the injection interval.

14. The estimated average surface injection pressure is expected to be approximately 810 psi. The maximum surface injection pressure will be 1,080 psi, based on the Division’s guideline limiting surface injection pressures to 0.2 psi per foot of depth to the top-most injection interval. The proposed injection volumes can be achieved without exceeding the maximum surface

injection pressure. Injection pressures and volumes will be continuously monitored through an electronic SCADA system.

15. In my opinion, the granting of WaterBridge's application is in the interests of conservation and the prevention of waste.

16. The attached exhibits were prepared by me, or compiled from company business records, or were prepared at my direction.

17. I attest under penalty of perjury under the laws of the State of New Mexico that the information provided herein is correct and complete to the best of my knowledge and belief.

WELL IN LEA COUNTY, NEW MEXICO.

CASE NO. 24570
(FPNM SWD #6)

AFFIDAVIT OF REED DAVIS

Reed Davis, of lawful age and being duly sworn, declares as follows:

1. My name is Reed Davis. I work for ALL Consulting as a Geophysicist. I have been retained by WaterBridge Stateline LLC (“WaterBridge”) (OGRID No. 330129).

2. I personal knowledge of the matters stated herein.

3. I have previously testified before the Oil Conservation Division (“Division”) as an expert witness in geology and geophysics and my credentials have been accepted by the Division and made a matter of record.

4. My area of responsibility includes the area of Lea County in New Mexico.

5. I am familiar with the application WaterBridge filed in this matter and I am familiar with the status of the lands and geology in the subject area.

6. In this case, WaterBridge seeks authorization to inject produced water into the Glorieta Sandstone formation through the FPNM SWD #6 well (the “Well”) into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet.

7. Exhibit A-1, Attachment 8, contains a statement I prepared that includes an overview of the geology of this area, as well as information regarding the low potential for induced seismicity if WaterBridge’s application is granted.

8. Based on my geology study, I have concluded that the Glorieta Sandston is well suited for injection because it is bounded by both an upper confining layer and a lower confining

layer, which will prevent migration of the injected fluids. The Glorieta primarily consists of Permian-age sandstone and is overlain by approximately 60 feet of low porosity carbonate rocks within the lower San Andres Formation, which would prevent the upward migration of injection fluid and serve as the upper confining layer. Additionally, approximately 28 feet of low porosity and low permeability other carbonate rocks lie beneath the proposed injection interval and act as a lower confining zone by preventing downward migration of injected fluids into the underlying Tubb Formation. Attachment I to my Letter are geophysical logs which depict the intervals above and below the proposed injection interval.

9. In my opinion, operating the Well will not impact the correlative rights of mineral owners because the proposed injection will remain within the target injection interval due to the upper and lower confining zones. There is no oil and gas production from the Glorieta Sandstone within the two-mile radius of the Well.

10. I also prepared a statement regarding seismicity, which was included in the C-108, also as Attachment 8.

11. Based on my study, in my opinion, the potential for the Well to cause injection-induced seismicity is expected to be minimal because (1) the presence of numerous confining layers above and below the injection interval, (2) the significant vertical distance between the injection zone and Precambrian basement rock in which the nearest fault has been identified, and (3) the vertical distance from, and lack of historic seismicity on, identified shallow faults in the area of review.

12. In my opinion, the granting of WaterBridge's application is in the interests of conservation and the prevention of waste.

13. The attached exhibits were prepared by me, or compiled from company business records, or were prepared at my direction.

14. I attest under penalty of perjury under the laws of the State of New Mexico that the information provided herein is correct and complete to the best of my knowledge and belief.

**Re: APPLICATION OF WATERBRIDGE STATELINE LLC
TO APPROVE SALT WATER DISPOSAL
WELL IN LEA COUNTY, NEW MEXICO.**

CASE NO. 24570

TO: AFFECTED PARTIES

This letter is to advise you that WaterBridge Stateline, LLC (“WaterBridge”) has filed the enclosed application.

In Case No. 24570, WaterBridge Stateline LLC seeks an order approving disposal into the Glorieta Sandstone formation through the FPNM SWD #6 well at a surface location 1,964’ from the North line and 2,170’ from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well. Applicant seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet. Applicant further requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day. Said area is located approximately 7.94 miles Southeast of Jal, New Mexico.

The hearing is set for June 27, 2024 beginning at 8:30 a.m. The hearing will be conducted in a hybrid fashion, both in-person at the Energy, Minerals, Natural Resources Department, Wendell Chino Building, Pecos Hall, 1220 South St. Francis Drive, 1st Floor, Santa Fe, NM 87505 and via a virtual meeting platform. To participate in the electronic hearing, see the instructions posted on the docket for the hearing date: <https://www.emnrd.nm.gov/ocd/hearing-info/>.

As a party who may be affected by this application, we are notifying you of your right to appear at the hearing and participate in this case, including the right to present evidence either in support of or in opposition to the

application. Failure to appear at the hearing may preclude you from any involvement in this case at a later date.

You are further notified that if you desire to appear in this case, then you are requested to file a Pre-Hearing Statement with the Division at least four business days in advance of a scheduled hearing before the Division or the Commission, but in no event later than 5:00 p.m. mountain time, on the Thursday preceding the scheduled hearing date, with a copy delivered to the undersigned.

Sincerely,

Deana M. Bennett

Attorney for Applicant

**STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION**

**APPLICATION OF WATERBRIDGE STATELINE LLC
TO APPROVE SALT WATER DISPOSAL
WELL IN LEA COUNTY, NEW MEXICO.**

CASE NO. 24570

APPLICATION

WaterBridge Stateline LLC (“WaterBridge”), OGRID No. 330129, through its undersigned attorneys, hereby submits this application to the Oil Conservation Division pursuant to the provisions of NMSA 1978, § 70-2-12, Rule No. 19.15.26, and Rule 19.15.4.8 for an order approving drilling of a salt water disposal well in Lea County, New Mexico. In support of this application, WaterBridge states as follows:

(1) WaterBridge proposes to drill the FPNM SWD #6 well at a surface location 1,964’ from the North line and 2,170’ from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well.

(2) WaterBridge seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet.

(3) WaterBridge requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day.

(4) WaterBridge requests approval of a maximum injection pressure of 1,080 psi for the well.

(5) A proposed C-108 for the subject well is attached hereto as Attachment A.

(6) The granting of this application will avoid the drilling of unnecessary wells, will prevent waste, and will protect correlative rights.

WHEREFORE, WaterBridge requests that this application be set for hearing before an Examiner of the Oil Conservation Division on June 13, 2024; and that after notice and hearing, the Division enter its order approving this application.

Respectfully submitted,

MODRALL, SPERLING, ROEHL, HARRIS
& SISK, P.A.

Oil Conservation Division
1220 South St. Francis Dr.
Santa Fe, New Mexico 87505

FORM C-108
Revised June 10, 2003

APPLICATION FOR AUTHORIZATION TO INJECT

I. PURPOSE: _____ Secondary Recovery _____ Pressure Maintenance X Disposal _____ Storage
Application qualifies for administrative approval? X Yes _____ No

II. OPERATOR: WaterBridge Stateline LLC

ADDRESS: 5555 San Felipe, Ste. 1200 Houston, TX 77056

CONTACT PARTY: Jessica High - Director, QHSE & Regulatory PHONE: 832-871-4064

III. WELL DATA: Complete the data required on the reverse side of this form for each well proposed for injection.
Additional sheets may be attached if necessary.

IV. Is this an expansion of an existing project? _____ Yes X No
If yes, give the Division order number authorizing the project: _____

V. Attach a map that identifies all wells and leases within two miles of any proposed injection well with a one-half mile radius circle drawn around each proposed injection well. This circle identifies the well's area of review.

VI. Attach a tabulation of data on all wells of public record within the area of review which penetrate the proposed injection zone. Such data shall include a description of each well's type, construction, date drilled, location, depth, record of completion, and a schematic of any plugged well illustrating all plugging detail.

VII. Attach data on the proposed operation, including:

1. Proposed average and maximum daily rate and volume of fluids to be injected;
2. Whether the system is open or closed;
3. Proposed average and maximum injection pressure;
4. Sources and an appropriate analysis of injection fluid and compatibility with the receiving formation if other than reinjected produced water; and,
5. If injection is for disposal purposes into a zone not productive of oil or gas at or within one mile of the proposed well, attach a chemical analysis of the disposal zone formation water (may be measured or inferred from existing literature, studies, nearby wells, etc.).

*VIII. Attach appropriate geologic data on the injection zone including appropriate lithologic detail, geologic name, thickness, and depth. Give the geologic name, and depth to bottom of all underground sources of drinking water (aquifers containing waters with total dissolved solids concentrations of 10,000 mg/l or less) overlying the proposed injection zone as well as any such sources known to be immediately underlying the injection interval.

IX. Describe the proposed stimulation program, if any.

*X. Attach appropriate logging and test data on the well. (If well logs have been filed with the Division, they need not be resubmitted).

*XI. Attach a chemical analysis of fresh water from two or more fresh water wells (if available and producing) within one mile of any injection or disposal well showing location of wells and dates samples were taken.

XII. Applicants for disposal wells must make an affirmative statement that they have examined available geologic and engineering data and find no evidence of open faults or any other hydrologic connection between the disposal zone and any underground sources of drinking water.

XIII. Applicants must complete the "Proof of Notice" section on the reverse side of this form.

XIV. Certification: I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

NAME: Oliver Seekins TITLE: Project Manager / Regulatory Specialist

SIGNATURE:  DATE: 5/13/2024

E-MAIL ADDRESS: oseekins@all-llc.com

* If the information required under Sections VI, VIII, X, and XI above has been previously submitted, it need not be resubmitted. Please show the date and circumstances of the earlier submittal: _____

DISTRIBUTION: Original and one copy to Santa Fe with one copy to the appropriate District Office

Application for Authorization to Inject
 Well Name: FPNM SWD #6

III – Well Data (The wellbore diagram is included as **Attachment 1**)

A.

(1) General Well Information:

Operator: WaterBridge Stateline LLC (OGRID No. 330129)
 Lease Name & Well Number: FPNM SWD #6
 Location Footage Calls: 1,964' FNL & 2,170' FWL
 Legal Location: UL F, S17 T26S R38E
 Ground Elevation: 2,983'
 Proposed Injection Interval: 5,400' - 5,775'
 County: Lea

(2) Casing Information:

Type	Hole Size	Casing Size	Casing Weight	Setting Depth	Sacks of Cement	Estimated TOC	Method Determined

DV Tool set at: 3,000'

(3) Tubing Information:

5-1/2" (17.0 lb/ft) ceramic-coated tubing with setting depth of 5,375'

(4) Packer Information: ACT AS1-X or equivalent packer set at 5,375'

B.

(1) Injection Formation Name: Glorieta Sandstone

Pool Name: SWD;Glorieta

Pool Code: 96106

(2) Injection Interval: Perforated injection between 5,400' - 5,775'

(3) Drilling Purpose: New drill for saltwater disposal

(4) Other Perforated Intervals: No other perforated intervals exist.

(5) Overlying Oil and Gas Zones: Below are the approximate formation tops for known oil and gas producing zones in the area.

- Yates (2,815')
- Seven Rivers (2,889')
- Queen (3,424')
- Penrose (3,730')

Underlying Oil and Gas Zones: Below are the approximate formation tops for known oil and gas producing zones in the area.

- Tubb (6,630')
- Devonian (9,098')

V – Well and Lease Details

The following maps and documents are included as **Attachment 2**:

- 2-mile Oil & Gas Well Map
- ½-mile AOR Well Table
- 2-Mile Lease Map
- 2-Mile Mineral Ownership Map
- 2-Mile Surface Ownership Map
- Potash Lease Map

VI – AOR Well List

A list of the well(s) within the 1/2-mile AOR is included in **Attachment 2**.

There are no wells in the ½-mile AOR.

VII – Proposed Operation

- (1) **Proposed Maximum Injection Rate:** 20,000 bpd
Proposed Average Injection Rate: 15,000 bpd
- (2) A **closed-loop system** will be used.
- (3) **Proposed Maximum Injection Pressure:** 1,080 psi (surface)
Proposed Average Injection Pressure: Approximately 810 psi (surface)
- (4) **Source Water Analysis:** The expected injectate will consist of produced water from production wells completed in the Queen, Wolfcamp, Devonian and Ellenburger formations. Analysis of water from these formations is included as **Attachment 3**.
- (5) **Injection Formation Water Analysis:** The proposed SWD will be injecting water into the Glorieta Sandstone, which is a non-productive zone known to be compatible with formation water from the Queen, Wolfcamp, Devonian and Ellenburger formations. Water analyses from the Glorieta Sandstone in the area are included as **Attachment 4**.

VIII – Geologic Description

The proposed injection interval includes the Glorieta Sandstone from 5,400' - 5,775'. The Permian-aged Glorieta Sandstone is a fine grained and well-to-moderately sorted quartz arenite sandstone that occurs directly below the San Andres Formation. There are multiple zones of high porosity and low resistivity that makes this sandstone a viable injection zone in this area.

Further discussion of the injection formation, overlying and underlying confinement zones, and historic use of the field are included as **Attachment 5**.

The base of the USDW is the Rustler Formation at a depth of approximately 1,140 feet. Depth of the nearest water well in the area is approximately 185 feet below ground surface.

IX – Proposed Stimulation Program

A small cleanup acid job may be used to remove mud and drill cuttings from the formation. However, no other formation stimulation is currently planned.

X – Logging and Test Data

Logs will be submitted to the Division upon completion of the well.

XI – Fresh Groundwater Samples

Based on a review of data from the New Mexico Office of the State Engineer, there is one (1) groundwater well located within 1-mile of the proposed SWD location. However, the well is not eligible for sampling because of its location in an area with aquifer production restrictions.

A water well map and details of the water well within 1-mile are included as **Attachment 6**.

XII – No Hydrologic Connection Statement

No publicly known faulting is present in the area that would provide a hydrologic connection between the injection interval and overlying USDWs. Additionally, the casing program has been designed to ensure there will be no hydrologic connection between the injection interval and overlying USDWs.

A signed *No Hydrologic Connection Statement* is included as **Attachment 7**.

In addition, a *Seismic Potential Letter* detailing the minimal risk of injection-induced seismicity associated with the proposed SWD is included as **Attachment 8**.

XIII – Proof of Notice

A public notice will be filed with the Hobbs News Sun newspaper, and an affidavit will be included as an exhibit at hearing.

A copy of the application will be mailed to the identified affected persons, with delivery confirmation being provided as an exhibit at hearing. A list of the identified affected persons is included as **Attachment 9**.

No allowance will be assigned to this completion until all interests have been consolidated or a non-standard unit has been approved by the division.

The map shows a rectangular well location on a grid. The well is located in Section 17, Township 26 S, Range 38 E. The well location is marked with a red dot and labeled 'SHL'. The well number is #6. The well is located 1964 feet north of the surface location and 2170 feet west of the surface location. The map also shows the boundaries of the well location and the surrounding grid. The coordinates for the corners of the well location are: X = 926205, Y = 384306; X = 928842, Y = 384332; X = 931486, Y = 384360; X = 926234, Y = 381665; X = 928903, Y = 379052; X = 931542, Y = 379080; X = 931514, Y = 381720. The map also shows the boundaries of the surrounding grid sections: 07, 08, 09, 16, 17, 18, 19, 20, 21.

OPERATOR CERTIFICATION
I, the undersigned, certify that the information contained herein is true and complete to the best of my knowledge and belief, and that this organization either owns a working interest or retained mineral interest in the land including the proposed bottom hole location or has a right to drill this well at this location pursuant to a contract with an owner of such a mineral or working interest, or is a voluntary pooling agreement or a compulsory pooling order heretofore entered by the division.

AS1-X MECHANICAL PACKER

The ACT AS1-X Packer is the most versatile of the mechanically set retrievable packers and may be used in any production application. Treating, testing, injecting, pumping wells, flowing wells, deep or shallow, the AS1-X is suited for all. The packer can be left in tension or compression, depending on well conditions and the required application. A large internal by-pass reduces swabbing when running and retrieving. The by-pass closes when the packer is set and opens prior to releasing the upper slips when retrieving to allow pressure equalization.

The J-slot design allows easy setting and releasing, 1/4 turn right-hand set, right-hand release. A patented upper-slip releasing system reduces the force required to release the packer. A non directional slip is released first, making it easier to release the other slips. The AS1-X packer can withstand 7,000 psi (48 MPa) of differential pressure above or below.

FEATURES, ADVANTAGES AND BENEFITS:

- The design holds high differential pressure from above or below, enabling the packer to meet most production, stimulation, and injection needs
- The packer can be set with compression, tension, or wire line, enabling deployment in shallow and deep applications
- The packer can be set and released with only a one-quarter turn of the tubing
- The bypass valve is below the upper slips so that debris are washed from the slips when the valve is opened, reducing the times for circulation and total retrieval

- The full opening enables unrestricted flow and the passage of wire line tools and other packer systems
- The packer can be run with the T-2 on-off tool, which enables the tubing to be disconnected and retrieved without retrieving the packer

OPTIONS:

- Elastomer options are available for hostile environments
- Optional safety releases are available

Confining Zones and Historic Pore Space Use

CONFINING ZONES AND HISTORIC PORE SPACE USAGE

For WaterBridge Stateline LLC's proposed FPNM SWD #6 application in the Lower Permian Glorieta Sandstone in the Central Basin Platform area, the lower San Andres Formation will act as the upper confinement zone, and the lower Glorieta Sandstone as the lower confinement zone, given its low porosity and high resistivity. The proposed location is in T26S., R38E, an area with very limited oil and gas production. Most area wells have been plugged and abandoned, and none penetrate the proposed injection intervals in the Glorieta Sandstone.

The San Andres Formation is a shelf carbonate deposit composed predominantly of dolomite, and in the proposed development area, the lower San Andres Formation is a tight rock with low porosity and high resistivity values. **Figure 1** is a log snip of this upper confining zone of approximately 60 feet in the lower San Andres Formation. The lower confining zone is a tight sandstone unit within the Glorieta Sandstone, which also has low porosity development and high resistivity readings. The Glorieta Sandstone is a fine-grained, well-to-moderately sorted quartz arenite sandstone. **Figure 2** is a log snip of this approximately 30 feet of lower Glorieta Sandstone.

The closest oil and gas production to the FPNM SWD #6 is the active waterflood operation directly to the west. This waterflood operation is the W.H. Rhodes B Federal NCT-1 unit project and was originally operated by Texaco, Inc., with the first waterflood injection commencing in 1964 and continued expansion occurring in 1969, 1973, and 1993 by Texaco Exploration and Production, Inc. Oil production and enhanced oil recovery water injection is into the Yates and Seven Rivers formations at depths ranging from approximately 3,000 to 3,400 feet and primarily located in T26S, R37E. There is no oil or gas production from the Glorieta Sandstone within the two-mile radius of the proposed FPNM SWD #6.

No Hydrologic Connection Statement

RE: Waterbridge Stateline LLC – FPNM SWD #6 application, Lea County, New Mexico

ALL Consulting LLC (ALL) has performed a thorough hydrologic investigation related to the one saltwater disposal well (SWD) listed above. The investigation was conducted to determine if there were any existing or potential connections between the proposed injection intervals in the Glorieta Sandstone and the deepest underground source of drinking water (USDW).

ALL performed an assessment and analysis of the subsurface geophysical log data along with published documents on the groundwater in this vicinity of Lea County, New Mexico. The surficial geology is Quaternary alluvial deposits consisting predominantly of sand and caliche. This area is south of the High Plains Aquifer and depths to potable water ranges from 30 to 142 feet below the surface. The USDW is the Rustler Formation and the base of the USDW ranges from 875 to 1,130 feet below the surface.

Based on ALL’s assessment and analysis there is containment through multiple confining zones in the San Andres Formation and the Salado evaporite deposits above the Glorieta Sandstone and the USDW and over 4,260 feet of vertical separation between the base of the USDW and the top of the injection interval. Additionally, there is no evidence of faults that would allow for communication between the USDW and Glorieta Sandstone.

Seismic Potential Letter

March 18, 2024

PN 1703.SWD.13

Mr. Phillip Goetze, P.G.
NM EMNRD – Oil Conservation Division
1220 South St. Francis Drive
Santa Fe, NM 87505

Subject: **WaterBridge Stateline LLC**
FPNM SWD #6 - Seismic Potential Letter

Dear Mr. Goetze,

At the request of WaterBridge Stateline LLC (WaterBridge), ALL Consulting, LLC (ALL) has assessed the potential injection-induced seismicity risks in the vicinity of WaterBridge’s FPNM SWD #6, a proposed saltwater disposal (SWD) facility in Lea County, New Mexico, and summarized the findings in this letter. This assessment used publicly available data to identify the proximity and characteristics of seismic events and known faults to evaluate the potential for the operation of the FPNM SWD #6 to contribute to seismic activity in the area.

Geologic Evaluation

The FPNM SWD #6 is requesting a permit to inject into the Permian Glorieta Sandstone (Glorieta) at a depth of 5,400-5,775 feet below ground surface (bgs). The Glorieta primarily consists of Permian-age sandstone and is overlain by approximately 60 feet of low porosity carbonate rocks within the lower San Andres Formation, which would prevent the upward migration of injection fluid and serve as the upper confining layer (see **Attachment 1**). Additionally, approximately 28 feet of low porosity and low permeability other carbonate rocks lie beneath the proposed injection interval and act as a lower confining zone by preventing downward migration of injected fluids into the underlying Tubb Formation (see **Attachment 1**). A stratigraphic chart depicting the geologic setting is included as **Figure 1**.¹

Seismic Events and Fault Data

A review of United States Geological Survey (USGS) and New Mexico Tech Seismological Observatory (NMTSO) earthquake catalogs determined that four (4) seismic events have been recorded within a 100 square mile area [9.08-kilometer (km) radius] around the subject SWD.

¹ Yang, K.-M., & Dorobek, S. L. (1995). The Permian Basin of west Texas and New Mexico: Tectonic history of a "composite" Foreland Basin and its effects on stratigraphic development. *Stratigraphic Evolution of Foreland Basins*, 149–174. <https://doi.org/10.2110/pec.95.52.0149>

WaterBridge Staline LLC
 FPNM SWD #6 Seismic Information
 March 18, 2024

The closest recorded seismic event was a M1.68 that occurred on July 22, 2017, and was located approximately 0.62 miles southwest of the FPNM SWD #6 (see **Attachment 2**).

Fault data from United States Geological Survey (USGS) and the Texas Bureau of Economic Geology (BEG)² indicates that the closest known fault is located approximately 0.29 miles west of the FPNM SWD #6 (see **Attachment 2**). This identified fault is within the Precambrian basement, which is approximately 8,225 feet below the proposed injection interval.³ Fault data from Sourcewater also indicates the presence of four faults in the sedimentary column, above the Precambrian basement, within the area of review.⁴ These shallow faults penetrate the Canyon, Cisco, and Wolfcamp formations which begin approximately 2,940 feet below the proposed injection interval. As previously discussed, there are confining barriers beneath the proposed injection interval which will prevent the downward migration of fluids into such faults. A map of the seismic events and faults within 9.08 km of the FPNM SWD #6 is included as **Attachment 2**.

Seismic Potential Evaluation

Experience in evaluating induced seismic events indicates that most injection-induced seismicity throughout the U.S. (e.g., Oklahoma, Ohio, Texas, New Mexico, and Colorado) occurs as a result of injection into Precambrian basement rock, into overlying formations that are in hydraulic communication with the Precambrian basement rock, or as a result of injection near critically stressed and optimally oriented faults. Seismicity at basement depths occurs because critically stressed faults generally originate in crystalline basement rock and may also extend into overlying sedimentary formations.⁵

WaterBridge Stateline LLC
 FPNM SWD #6 Seismic Information
 March 18, 2024

Injection into either the Precambrian basement rock or its overlying formations that are hydraulically connected to the basement rock through faulting or fracture networks can increase the pore pressure and may lead to the fault slipping, resulting in a seismic event.⁴ As such, the vertical distance between the injection formation and Precambrian basement rock and the presence or lack of faulting within the injection interval are major considerations when determining the risk of injection-induced seismicity.

Geophysical logs from nearby well records show at least 8,225 feet of vertical separation between the injection interval and the Precambrian basement.³ In addition, injection-induced seismicity is not typically associated with shallow disposal wells in the Central Basin Platform and Delaware Basin areas, such as the FPNM SWD #6.

For injection into the Glorieta Sandstone to contribute to seismic activity, one of two hypothetical geologic scenarios must exist:⁶

1. Scenario #1: Earthquake hypocenters would need to be significantly shallower (several kilometers) than initially identified by the USGS and NMTSO seismic monitoring networks, and thus placing seismic activity high in the sedimentary column, rather than in the Precambrian basement.
2. Scenario #2: This scenario would require that both of the following conditions are met:
 - a. Fault Transmissivity: High permeability and transmissive conduits from fault-damaged zones would need to be present below the Glorieta, allowing fluid to migrate through the underlying Tubb Formation and through significantly deeper confining intervals, and eventually into the Precambrian basement.
 - b. Pore Pressure: The injection fluids and bottom hole pressures in the Glorieta would need to exceed existing hydrostatic pressures within the deeper geologic formation in order for injection fluids to migrate downward.

There are no publications or geologic data that suggest either of these scenarios to be true for the area around the FPNM SWD #6.

Formation Parting Pressure

Class II SWDs in New Mexico are administratively permitted with a maximum pressure gradient of 0.2 psi/ft. Review of New Mexico Oil Conservation Division (OCD) Order IP-476 submitted by Chevron USA Inc. in support of the Vacuum Glorieta West Unit, which is located approximately 60 miles northwest of the FPNM SWD #6, determined the fracture gradient of the Glorieta in the region ranges from 0.26-0.39 psi/ft from approved step-rate tests. Typical SWD permitting standards in New Mexico, and the requested operating parameters of the FPNM SWD #6, would indicate that formation parting pressure would not be exceeded by the FPNM SWD #6.

⁶ Skoumal, Robert J., et al. "Induced Seismicity in the Delaware Basin, Texas." *Journal of Geophysical Research: Solid Earth*, vol. 125, no. 1, 2020, doi:10.1029/2019jb018558.

WaterBridge Stateline LLC
FPNM SWD #6 Seismic Information
March 18, 2024

Conclusion

As an expert on the issue of induced seismicity, seismic monitoring, and mitigation, it is my opinion that the potential for the FPNM SWD #6 to cause injection-induced seismicity is expected to be minimal, at best. This conclusion assumes the FPNM SWD #6 will be operated below formation parting pressure and is based on (1) the presence of numerous confining layers above and below the injection interval, (2) the significant vertical distance between the injection zone and Precambrian basement rock in which the nearest fault has been identified, and (3) the vertical distance from, and lack of historic seismicity on, identified shallow faults in the area of review.

Sincerely,
ALL Consulting, LLC

Reed Davis
Geophysicist

LEGAL NOTICE June 9, 2024

CASE NO. 24568: Notice to all affected parties, as well as heirs and devisees of: D.K. Boyd; New Mexico Oil Conservation District 1; New Mexico Bureau of Land Management; Apache Corporation; FAE II Operating LLC; LeaCo Operating, LLC; Magnum Producing, LP; Burlington Resources Oil & Gas Company LP; BXP Energy Resources V, LLC; MNA Enterprises LTD CO of the Application of WaterBridge Stateline LLC for approval of a salt water disposal well in Lea County, New Mexico. The State of New Mexico through its Oil Conservation Division hereby gives notice that the Division will conduct a public hearing at 8:30 a.m. on June 27, 2024 to consider this application. The hearing will be conducted in a hybrid fashion, both in-person at the Energy, Minerals, Natural Resources Department, Wendell Chino Building, Pecos Hall, 1220 South St. Francis Drive, 1st Floor, Santa Fe, NM 87505 and via a virtual meeting platform. To participate in the electronic hearing, see the instructions posted on the docket for the hearing date: <https://www.emnrd.nm.gov/ocd/hearing-info/>. Applicant seeks an order approving disposal into the Glorieta Sandstone formation through the FPNM SWD #1 well at a surface location 2532' from the North line and 1545' from the East line, Unit G, Section 25, Township 26 South, Range 37 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well. Applicant seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,350 feet to 5,725 feet. Applicant further requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day. Said area is located approximately 8.2 miles Southeast of Jal, New Mexico.

CASE NO. 24569: Notice to all affected parties, as well as heirs and devisees of: D.K. Boyd; New Mexico Oil Conservation District 1; New Mexico Bureau of Land Management; Blackbeard Operating, LLC; Magnum Producing, LP; R&R Royalty LTD of the Application of WaterBridge Stateline LLC for approval of a salt water disposal well in Lea County, New Mexico. The State of New Mexico through its Oil Conservation Division hereby gives notice that the Division will conduct a public hearing at 8:30 a.m. on June 27, 2024 to consider this application. The hearing will be conducted in a hybrid fashion, both in-person at the Energy, Minerals, Natural Resources Department, Wendell Chino Building, Pecos Hall, 1220 South St. Francis Drive, 1st Floor, Santa Fe, NM 87505 and via a virtual meeting platform. To participate in the electronic hearing, see the instructions posted on the docket for the hearing date: <https://www.emnrd.nm.gov/ocd/hearing-info/>. Applicant seeks an order approving disposal into the Glorieta Sandstone formation through the FPNM SWD #3 well at a surface location 2,512' from the North line and 1,133' from the West line, Lot 2, Section 29, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well. Applicant seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet. Applicant further requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day. Said area is located approximately 9.20 miles Southeast of Jal, New Mexico.

CASE NO. 24570: Notice to all affected parties, as well as heirs and devisees of: D.K. Boyd; New Mexico Oil Conservation District 1; New Mexico Bureau of Land Management; Armstrong Energy Corporation; R&R Royalty, Ltd.; Ida Kristine Hanson; Elizabeth W., Goff et al. of the Application of WaterBridge Stateline LLC for approval of a salt water disposal well in Lea County, New Mexico. The State of New Mexico through its Oil Conservation Division hereby gives notice that the Division will conduct a public hearing at 8:30 a.m. on June 27, 2024 to consider this application. The hearing will be conducted in a hybrid fashion, both in-person at the Energy, Minerals, Natural Resources Department, Wendell Chino Building, Pecos Hall, 1220 South St. Francis Drive, 1st Floor, Santa Fe, NM 87505 and via a virtual meeting platform. To participate in the electronic hearing, see the instructions posted on the docket for the hearing date: <https://www.emnrd.nm.gov/ocd/hearing-info/>. Applicant seeks an order approving disposal into the Glorieta Sandstone formation through the FPNM SWD #6 well at a surface location 1,964' from the North line and 2,170' from the West line, Unit F, Section 17, Township 26 South, Range 38 East, NMPM, Lea County, New Mexico for the purpose of operating a produced water disposal well. Applicant seeks authority to inject produced water into the Glorieta Sandstone formation at a depth of approximately 5,400 feet to 5,775 feet. Applicant further requests that the Division approve a maximum daily injection rate for the well of 20,000 bbls per day. Said area is located approximately 7.94 miles Southeast of Jal, New Mexico.
