Review of 2020 Fourth Quarter Groundwater Monitoring: Content satisfactory

1. Follow recommendations stated within Fourth Quarter Groundwater Monitoring Report.
  - a. Complete evaluation for deeper seated monitor well installations to replace MW-B, MW-D, MW-E, MW-F, and MW-GR, then execute.
  - b. Install another monitor well in a down-gradient position with respect to MW-GR to define the lateral extent of the dissolved-phase contaminant plume

## Table of Contents

1.	Introduction.....	1
1.1	Site History.....	1
2.	Regulatory Framework .....	1
3.	Groundwater Monitoring.....	2
3.1	Methodology of Groundwater Monitoring.....	2
3.2	Potentiometric Surface and Gradient.....	2
3.3	Presence of Light Non-aqueous Phase Liquid .....	2
4.	Dissolved-phase Hydrocarbons in Groundwater .....	3
5.	Corrective Action .....	3
6.	Conclusions and Recommendations.....	3

- Figure 4 Dissolved BTEX in Groundwater—December 15, 2020

## Table Index

- Table 1 Summary of Fluid Level Measurements and Fluids Removed
- Table 2 Summary of Analytical Results and Physical Parameters in Groundwater

## Appendix Index

- Appendix A Notes of Field Activities
- Appendix B Charts of Thicknesses of LNAPL in Monitor Wells vs. Time
- Appendix C Charts of Concentrations of Dissolved Benzene in Monitor Wells vs. Time
- Appendix D Certified Analytical Report

## 1. Introduction

GHD Services Inc. (GHD) is submitting *Report of Groundwater Monitoring in the Fourth Quarter of 2020* to DCP Operating Company (DCP) for the Hobbs Gas Plant Site (Site) in Lea County, New Mexico. This report summarizes the results of the quarterly monitoring event conducted on December 15, 2020.

### 1.1 Site History

The Site is an inactive cryogenic gas processing plant located in Lea County, New Mexico, approximately nine miles west of Hobbs, New Mexico (Figure 1). The location of the Site according to the Public Land Survey System is SW/4-NE/4-Section 36-T18S-R36E. Latitude and longitude of the Site are 32.705330°N and 103.306600°W, respectively. The Site occupies approximately 3.5 acres surrounded by undeveloped land. The facility contained a laboratory, an amine unit, compressors, molecular sieve dehydration equipment, tank batteries, and an on-Site water production well used for non-potable water. There are seven on-Site groundwater monitor wells (MW-AR, MW-B, MW-C, MW-D, MW-E, MW-F, and MW-GR). Replacement monitor well MW-GR was drilled and constructed at the Site upon approval from New Mexico Oil Conservation Division (NMOCD) in March 2018. The DCP Apex Compressor Station (GW-163, Incident ID NAUTOFCS000131) is located approximately 750 feet to the north. Site details are shown on Figure 2.

A petroleum release was first discovered when Duke Energy Field Services conducted an environmental assessment of the Site in support of a property transaction. Initial findings indicated groundwater from a newly installed monitor well near the amine skid in the southeast corner of the Site contained elevated concentrations of benzene.

## 2. Regulatory Framework

The Site has been assigned an Abatement Plan number AP-122 and Incident Number NPAC0706832026 by the New Mexico Oil Conservation Division (NMOCD) of the New Mexico Environment, Mining and Natural Resources Department. New Mexico Administrative Code (NMAC) 20.6.2.3103 Section A provides Human Health Standards for Groundwater for the New Mexico Water Quality Control Commission (NMWQCC). The constituents of concern (COCs) in affected groundwater at the Site are benzene, toluene, ethylbenzene, and total xylenes (BTEX). The regulation also states that non-aqueous phase liquids shall not be present floating atop or immersed within groundwater, as can be reasonably measured. NMWQCC Human Health Standards for dissolved benzene, toluene, ethylbenzene, and total xylenes (BTEX) in groundwater are shown in Table 2.1.

**Table 2.1 NMWQCC Human Health Standards**

Analyte	NMWQCC Human Health Standard for Groundwater
Benzene	5 µg/L
Toluene	1000 µg/L
Ethylbenzene	700 µg/L
Total Xylenes	620 µg/L

## 3. Groundwater Monitoring

### 3.1 Methodology of Groundwater Monitoring

The monitoring event for the fourth quarter of 2020 was conducted on December 15, 2020. Each well cap was removed to allow groundwater levels to stabilize prior to gauging. Static fluid levels were measured using an electronic oil-water interface probe to the nearest hundredth of a foot to determine the thickness of light non-aqueous phase liquid (LNAPL), if present, and elevations of the potentiometric surface. All non-disposable groundwater sampling equipment was decontaminated with a soap (Alconox®) and potable water wash; a potable water rinse; and a final distilled water rinse before gauging began and between wells. After recording all fluid levels, wells were purged of at least three casing volumes of groundwater or until the well was purged dry. Wells that contained measurable ( $\geq 0.01$  ft.) LNAPL were not purged or sampled. Each sample of groundwater was collected using a new, disposable polyethylene bailer. Laboratory-supplied sample containers were filled directly from bailers. A field duplicate sample was collected from the last monitor well sampled. Groundwater samples were placed on ice in insulated coolers immediately after collection and chilled to a maximum temperature of 4°C (40°F). Proper chain-of-custody documentation accompanied samples to Pace Analytical in Mt. Juliet, Tennessee. All samples were analyzed for BTEX constituents according to U.S. Environmental Protection Agency (EPA) method 8260B. Field notes documenting gauging, purging, and sampling during the groundwater monitoring event in December 2020 are presented as Appendix A.

### 3.2 Potentiometric Surface and Gradient

Based on subsurface groundwater investigations conducted at the Site, the Ogallala Aquifer is the groundwater bearing unit and depth to groundwater is approximately 72 ft. below ground surface (bgs). The direction of flow of groundwater during the monitoring event in December 2020 was southeast with a gradient of 0.0091 ft./ft. (Figure 3). All wells gauged in December 2020 indicated a decline in the elevation of the potentiometric surface. The average decline was 0.69 foot from the third quarterly event of 2020 in August to the fourth quarterly event conducted in December 2020.

### 3.3 Presence of Light Non-aqueous Phase Liquid

Monitor wells MW-AR, MW-B, and MW-D were dry during the quarterly monitoring event in December. Measurable thickness of LNAPL was not observed in any monitor well during the monitoring event in December 2020. Fluid levels, LNAPL thicknesses, and elevations are summarized in Table 1. Charts showing thicknesses of LNAPL vs. time in MW-B and MW-C are in Appendix B. They indicate declining trends of LNAPL thicknesses in those wells.

## 4. Dissolved-phase Hydrocarbons in Groundwater

Monitor wells MW-AR, MW-B, and MW-D were dry during the monitoring event in December. Monitor well MW-GR had insufficient groundwater in its casing to collect a sample. Groundwater samples collected from monitor wells during the quarterly monitoring event in December 2020 were analyzed for BTEX constituents by EPA method 8260B. Dissolved benzene was detected only in MW-C but at a concentration below the NMWQCC Human Health Standard of 5 µg/L. Total xylenes were detected in MW-C but at levels below the NMWQCC Human Health Standard. Neither toluene nor ethylbenzene were detected in any sample collected during the monitoring event in December 2020. Analytical results from previous samples collected from monitor well MW-GR suggest that benzene at that location have been present at a level exceeding the NMWQCC Human Health Standard for benzene (5 µg/L); however, insufficient water was present in MW-GR to collect a sample. Toluene, ethylbenzene, and total xylenes had been detected in previous samples collected from MW-GR, but only at levels below the Human Health Standards since June 2018.

A duplicate sample was collected from MW-C. Benzene and total xylenes were also detected in the duplicate sample. There were no significant differences (percent difference greater than 50%) between the initial sample and the duplicate sample with respect to both benzene and total xylenes. Analytical results for groundwater samples collected from the Site during the monitoring event in December 2020 are included in Table 2 and displayed on Figure 4. Charts in Appendix C show concentrations of dissolved benzene vs. time in monitor wells MW-B, MW-C, and MW-GR. The laboratory analytical report and chain of custody documentation are presented as Appendix D.

## 5. Corrective Action

In April 2014, LNAPL abatement was initiated at the Site. During 2014, LNAPL was bailed by hand from MW-B and MW-C. The cumulative total of LNAPL recovered from the Site during 2014 was approximately 2.65 gallons. LNAPL was bailed by hand from MW-B and MW-C during the first and third quarters of 2015 with approximately 0.10 gallon being recovered. There has been no LNAPL bailed by hand from MW-B or MW-C since 2015. The total estimated cumulative volume of LNAPL recovered from the Site via hand bailing since 2014 is 2.75 gallons.

During the first quarter of 2015, enhanced fluid recovery (EFR) events were initiated at the Site in wells MW-B and MW-C. EFR utilizes a vacuum truck and drop hose capable of sealing the well and reaching beyond the static water table to remove LNAPL and groundwater. There were no EFR events conducted during the fourth quarter of 2020.

The approximate cumulative total of LNAPL recovered from the Site since April 2014 and through August 2020 via hand bailing and EFR events is 8.225 gallons.

## 6. Conclusions and Recommendations

Based on groundwater monitoring and remedial activities performed by GHD at the Site during December 2020, the following summary of findings is presented:

- Monitor wells MW-AR, MW-B, and MW-D were dry during the monitoring event in December. Monitor well MW-GR had insufficient groundwater in its casing to collect a sample.
- Groundwater flowed to the southeast with a gradient of 0.0091 ft./ft.
- All wells gauged on December 15, 2020 indicated a decrease in the elevation of the potentiometric surface. The average decrease in elevation of the potentiometric surface from August to December 2020 was 0.69 ft. The decrease at MW-GR, a well with consistent impacts by dissolved benzene in excess of the Human Health Standard, was such that the well could not be sampled during the fourth quarterly event in 2020 due to insufficient water column.
- A measurable thickness of LNAPL ( $\geq 0.01$  ft.) was not detected in any monitor well during the monitoring event in December 2020.
- Dissolved benzene was detected in the sample from monitor well MW-C at a concentration below the Human Health Standard. Benzene was not detected in any other sample. Toluene and ethylbenzene were not detected in any sample collected during the fourth quarterly monitoring event in December 2020. Total xylenes were detected only in MW-C and at a concentration below the NMWQCC Human Health Standard.
- Approximately 8.225 gallons of LNAPL have been recovered from the Site since April 2014.

For the first quarter of 2021, GHD recommends the following:

- Evaluate the need for installation of monitor wells to replace MW-B, MW-D, MW-E, MW-F, and MW-GR, because the declining water table has left little groundwater in those wells. Consideration should also be given to installation of another monitor well in a down-gradient position with respect to MW-GR to define the lateral extent of the dissolved-phase contaminant plume within the NMWQCC Human Health Standards.

All of Which is Respectfully Submitted,

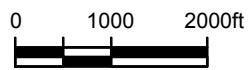

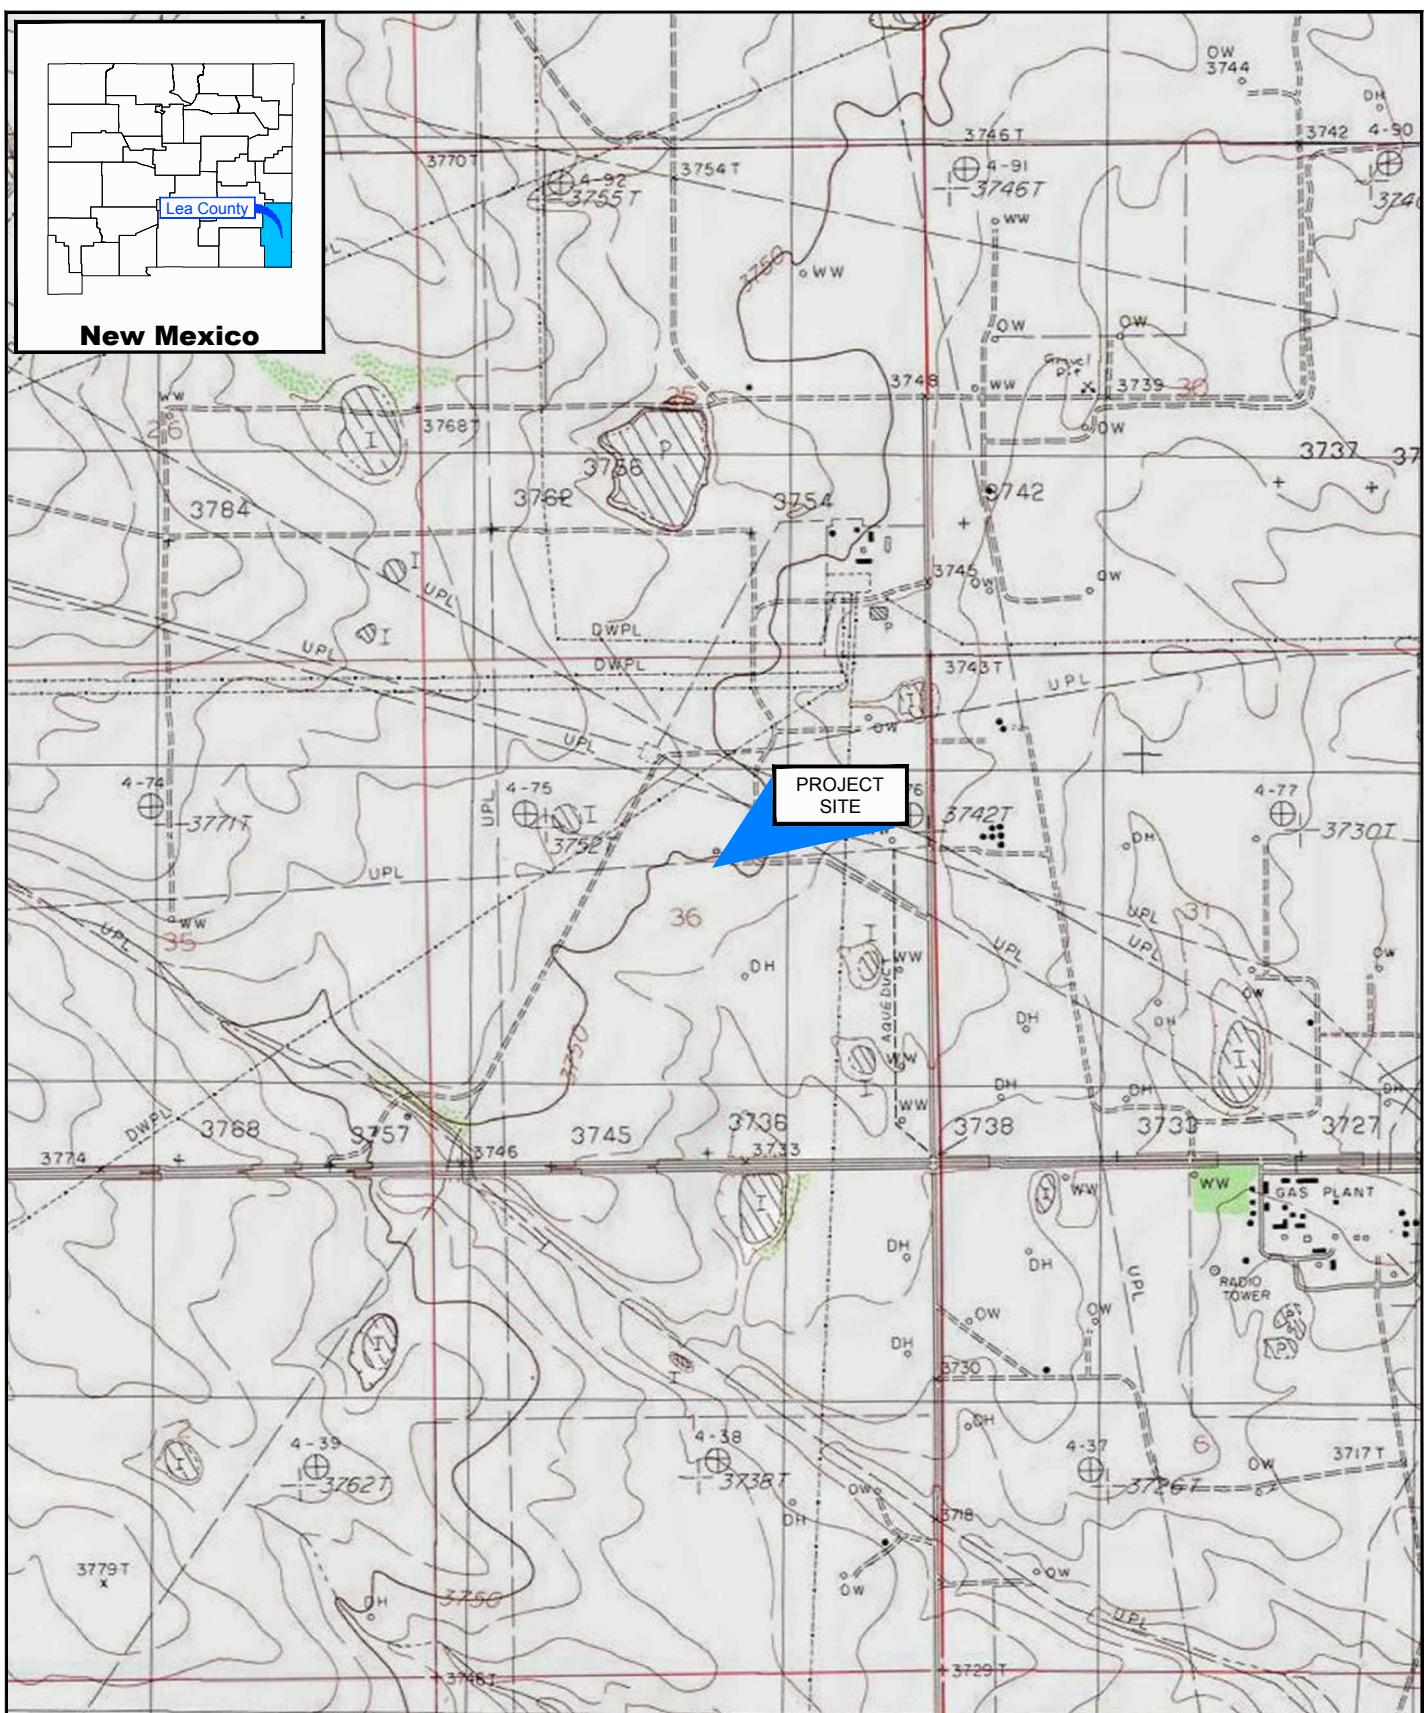

GHD

**Hobbs Gas Plant**  
**Lea County, New Mexico**

<i>Elevation of Top of Casing Well ID</i>	<i>Date</i>	<i>Depth to Water (fbtoc)</i>	<i>Depth to LNAPL (fbtoc)</i>	<i>LNAPL Thickness (ft.)</i>	<i>Elevation of Potentiometric Surface (famsl)</i>	<i>Measured Total Depth (fbtoc)</i>	<i>Volume LNAPL Recovered (gal.)</i>	<i>Volume Groundwater Bailed (gal.)</i>	<i>Volume Groundwater Removed via EFR (gal.)</i>
---	-------------	---------------------------------------	---------------------------------------	--------------------------------------	--	---	--	---	--

**Notes:**

1. fmsl = feet above mean sea level
2. fbtoc = feet below top of casing
3. LNAPL = Light non-aqueous phase liquids
4. Where measureable LNAPL was present, elevation of the potentiometric surface was calculated using 0.81 as specific gravity of LNAPL
5. MW-G was overdrilled and new casing installed in March 2018.
6. Wells were re-surveyed on 9/25/2013.

Table 2

**Summary of Analytical Results and Physical Parameters in Groundwater**  
**DCP Midstream LP**  
**Hobbs Gas Plant**  
**Lea County, New Mexico**

Well ID	Sample Date	Benzene ( $\mu\text{g/L}$ )	Toluene ( $\mu\text{g/L}$ )	Ethylbenzene ( $\mu\text{g/L}$ )	Total Xylenes ( $\mu\text{g/L}$ )	pH (s.u.)	Conductivity ( $\mu\text{S/cm}$ )	Temperature ( $^{\circ}\text{C}$ )	DO ( $\text{mg/L}$ )	ORP ( $\text{mV}$ )
<b>NMWQCC Human Health Standards</b>		<b>5</b>	<b>1000</b>	<b>700</b>	<b>620</b>					
Water Supply Well	08/14/06	<0.5	<5.0	<0.5	<1.5	7.47	473	20.91	4.61	31.7
Trip Blank	06/24/20	<0.0941	<0.278	<0.137	<0.174					

Notes:

1. A factor of 0.81 for the specific gravity of LNAPL is used to calculate the elevation of the potentiometric surface where LNAPL was present.
2. DO = Dissolved oxygen
3. ORP = Oxidation reduction potential
4. s.u. = Standard unit
5.  $\mu\text{S}/\text{cm}$  = Microsiemens per centimeter
6. mV = Millivolts
7. NMWQCC = New Mexico Water Quality Control Commission
8. Bold font indicates concentration above the NMWQCC Human Health Standards

**Daily Job Safety Analysis (JSA)  
Review Documentation Form**

**Site Personnel Participating in JSA review:**

I have participated in the review and discussion of the Job Safety Analysis (JSA) listed on this document and understand the duties I am responsible to fulfill. As part of my work, I know I have the responsibility and obligation to STOP work with a **Stop Work Authority (SWA)** if conditions change and/or potential hazards have been identified.

Print Name

Zach Lanning

Signature

 Austin, TX 78729

Entire Report Reviewed By:

Chris Ward  
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

**Results Disclaimer -** Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

### Abbreviations and Definitions

MDL	Method Detection Limit.	1 Cp
MQL	Method Quantitation Limit.	2 Tc
RDL	Reported Detection Limit.	3 Ss
Rec.	Recovery.	4 Cn
RPD	Relative Percent Difference.	5 Sr
SDG	Sample Delivery Group.	6 Qc
SDL	Sample Detection Limit.	7 GI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	8 AI
U	Not detected at the Sample Detection Limit.	9 SC
Unadj. MQL	Unadjusted Method Quantitation Limit.	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

### Qualifier      Description

J	The identification of the analyte is acceptable; the reported value is an estimate.
---	---

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- \* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- \* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.
