Additional details for Measured or Estimated Volume(s). Please specify	Not answered.
Is this a gas only submission (i.e. only significant Mcf values reported)	Yes, according to supplied volumes this appears to be a "gas only" report.

Venting or Flaring Resulting from Downstream Activity	
Was this vent or flare a result of downstream activity	No
Was notification of downstream activity received by this operator	Not answered.
Downstream OGRID that should have notified this operator	Not answered.
Date notified of downstream activity requiring this vent or flare	Not answered.
Time notified of downstream activity requiring this vent or flare	Not answered.

Steps and Actions to Prevent Waste	
For this event, this operator could not have reasonably anticipated the current event and it was beyond this operator's control.	True
Please explain reason for why this event was beyond this operator's control	High Line pressure but Cimarex Production's explanation is as follows: the back pressure valve some more supply gas as well as screwed in the valve to hold more pressure. Looks like we started flaring when line pressure shot up above 175psi. We should have shut in before that. The Flare vessel kill is at 200. I looked at how much supply air we have total and its only about 110psi. The flare valve needs at least 70% supply of what we're holding so we can only hold about 160 line psi before shutting in.
Steps taken to limit the duration and magnitude of vent or flare	Mechanical issues have been resolved.
Corrective actions taken to eliminate the cause and reoccurrence of vent or flare	Facility rarely flares above the 50/mcf threshold and facility is back to normal.
