1. Introduction

GHD Services Inc. (GHD), on behalf of Scout Energy Management (Scout), submits herein to the Railroad Commission of Texas (RRC) the 2023 Comprehensive *Groundwater Monitoring Report (March 2023)* for the Dollarhide Oil Field Unit located in Andrews County, Texas (Site). The latitude and longitude coordinates for the Site are 32° 08' 45.60" N and 103° 03' 20.12" W, and a vicinity map showing the Site location is included as Figure 1.

This report presents a summary and evaluation of the comprehensive groundwater monitoring data collected in March of 2023. It should be noted that following meetings with the RRC and the New Mexico's Oil Conservation Division (OCD) on April 18 and 19, 2022, respectively, consensus was reached on the proposed strategy and path forward to closure for the Site. The agreed upon path forward includes the following:

- Three (3) groundwater monitoring events from a limited well network composed of perimeter and interior source wells.
- One (1) comprehensive groundwater monitoring event to demarcate the impacted groundwater extent and record COCs remaining in groundwater to be included in the Restrictive Covenants (RCs) for each property owner.

This report summarizes the comprehensive groundwater monitoring event. The results of the three (3) groundwater monitoring events from a limited well network composed of perimeter and interior source wells were summarized in two reports, Semi-Annual Groundwater Monitoring Report (January-June 2022) dated August 8, 2022, and Semi-Annual Groundwater Monitoring Report (July Through December 2022), dated March 14, 2023, all of which were provided to the RRC.

2. Background

GHD understands historical operations at the Site contributed to elevated chloride concentrations in groundwater in the Ogallala Aquifer underlying the Site. The Dollarhide Oil Field was discovered as an oil and gas production field in 1945 and, over the years, was owned and operated and/or leased by various companies disposing of excess produced water fluids into pits. However, the use of pits for water disposal ceased in 1967, and the Site operators began using an injection system for disposal. In 1971, the first evidence of elevated chloride concentrations in groundwater was identified in wells located in Tract 26, and then in 1974 in Tract 45 wells. Groundwater assessments

were initiated in 1974, and a groundwater recovery system was installed in 1994 by Union Oil Company of California (Unocal), the field operator at that time.

Representatives of Unocal and the RRC participated in a meeting on June 2, 1994, to discuss the installation of 24 recovery wells and the recovery system located along the Texas and New Mexico State Line to remove chloride-impacted groundwater from the Ogallala Aquifer. Unocal received RRC approval of the recovery system in written correspondence on July 7, 1994. Since 1994, two additional recovery wells were installed, totaling 26 recovery wells recovering groundwater from the Site. The recovered groundwater was pumped into two on-Site injection wells for oil reservoir pressure maintenance. Chevron U.S.A., Inc. (Chevron) purchased Unocal in August 2005 and continued to operate the groundwater recovery system until the system shutdown in November 2017, with concurrence from the RRC and OCD. On October 1, 2021, Chevron completed the sale of the Dollarhide Oil Field Unit to Scout. Currently there are 74 monitor wells installed at the site, of which 21 are in New Mexico.

2.1 Former Pits

Prior to the 1970s, it was an accepted practice in oil field operations to store produced water (brine) in unlined pits adjacent to well locations. After livestock water wells in the vicinity of the Site began exhibiting elevated chloride concentrations, Unocal began investigating potential chloride sources. Historical aerial photographs were reviewed to assess potential source areas. A 1955 aerial photograph identified the presence of approximately 84 former produced water pits adjacent to Site well locations. A large-scale evaporation pit located to the northwest of the existing gas plant that had been utilized to store mixed brine was also identified by Unocal as a potential source area.

In 1997, Unocal installed soil borings in all former pit locations to assess possible chlorides in soil leaching to groundwater, with soil samples collected from various depths within the former pits and submitted for laboratory analysis of chlorides. Based on these soils results, former pit locations with soil chloride concentrations less than 700 parts per million (ppm) were determined by Unocal not to be potential source areas and were left in place. Moreover, former pit locations with soil chloride concentrations greater than 700 ppm were determined to be potential source areas, and Unocal capped the pits with a geosynthetic clay liner (Claymax®) to prevent any further leaching of chlorides to groundwater. Claymax® is a geosynthetic clay liner (GCL) with two lightweight nonwoven geotextiles encapsulating a layer of sodium bentonite.

2.2 Light Non-Aqueous Phase Liquid

During a groundwater sampling event in January 2000, dissolved hydrocarbon constituents and light non-aqueous phase liquid (LNAPL) were detected in recovery well 44-J-WW during a routine groundwater sampling event. The LNAPL exhibited elevated concentrations of hydrocarbons in the C6-C12 range, indicative of natural gas liquids. A north-south trending underground pipeline that contains hydrocarbon products, operated by another company (not Scout), is located within 100 feet of monitor well 44-J-WW. Soil investigations were conducted in 2000 by Unocal and 2011 by Chevron, to determine the source area of the release; however, no hydrocarbon impacts were detected in soils.

On November 5, 2010, LNAPL was discovered in two additional recovery wells, 44-I-WW and 44-II-WW, during routine operation and maintenance. Due to the presence of LNAPL, these three wells remained inactive through November 2017, when the groundwater recovery system was shut down to prevent the introduction of LNAPL into the groundwater recovery system. The LNAPL identified in these three wells (44-J-WW, 44-I-WW, and 44-II-WW) is not located near any of Chevron's former assets containing hydrocarbons, and the LNAPL is believed to be associated with other third-party pipelines in the vicinity. LNAPL investigation efforts have been summarized in previous reports that have been submitted to the RRC.

3. Regulatory Framework

The RRC has regulatory jurisdiction over oil and gas production operations in the State of Texas. Scout is working under the guidance of the RRC to address the groundwater chloride impacts because of historic operations at the Site. Under the RRC, the Site is regulated under Title 16 of the Texas Administrative Code (TAC) Chapter 3 (relating to the Oil and Gas Division) Rule §3.8(b) (Statewide Rule 8 Water Protection).

Due to the proximity of the Site being located near the Texas and New Mexico state boundaries, correspondence with the New Mexico's Oil Conservation Division (OCD) has been maintained on Site activities relating to the groundwater assessment being completed under the jurisdiction of the RRC. Per OCD's request, a Release Notification and Corrective Action (C-141) Form was submitted in a written correspondence on October 28, 2015, to establish a file for the Site. Routine meetings are held with both regulatory agencies providing project status updates and ensure that there is regulatory alignment with respect to the proposed path forward for the Site.

4. Groundwater Monitoring

As discussed in Section 1, following agency meetings with the RRC and OCD in April 2022, it was agreed upon that the next two quarterly groundwater sampling events be conducted from a limited well matrix consisting of perimeter and source monitoring wells, and one quarterly sampling event be conducted from the comprehensive set of monitoring wells throughout the Site. As such, this report summarizes the comprehensive monitoring event.

The groundwater monitoring system for the comprehensive monitoring event includes sampling 23 monitor wells and three non-remedial wells screened in the Ogallala Aquifer approximately 120 feet below ground surface (bgs). Comprehensive groundwater well designations are shown in Figure 2 and listed in Table 1. The groundwater data collected during the March 2023 comprehensive monitoring event is discussed below.

4.1 Potentiometric Conditions

Prior to sampling, depth-to-groundwater measurements were collected at each well with an oil/water interface probe, with an accuracy of 0.01 foot, to determine the groundwater elevation in each well. Groundwater potentiometric elevations and contours for the March 2023 event are presented in Figure 3. The well measurements indicate that the groundwater flow direction is generally to the southwest which is consistent with historical sampling events. A summary of the depth-to-groundwater measurements and the corresponding groundwater elevations are included in Table 2. Historical groundwater elevations are also provided in Appendix A.

4.2 Groundwater Sampling

For the 2023 comprehensive sampling event, groundwater samples were collected via no purge sampling techniques. The groundwater samples were collected directly from the screened interval of each well using a HYDRASleeve™ sampler. These samplers are considered instantaneous grab-sampling devices designed to collect water samples from groundwater wells without purging or mixing fluid from other intervals.

The HYDRASleeve™ was deployed during the gauging event to allow the well to return to equilibrium prior to sampling. Groundwater samples were collected in laboratory-supplied containers, preserved on ice, and transported to Eurofins Xenco Laboratory located in Midland, Texas, following proper chain-of-custody procedures. All groundwater samples were submitted for analysis of chloride by United States Environmental Protection Agency (EPA) Method 300/300.1 and Total Dissolved Solids (TDS) by EPA Method SM 2540C.

4.3 Analytical Results

Groundwater sample analytical results were compared to the Texas Commission of Environmental Quality (TCEQ) Secondary Drinking Water Standards and Secondary Constituent levels for chlorides (300 milligrams per liter [mg/L]) and TDS (1,000 mg/L). The groundwater sample analytical results from the 2023 event are listed in Table 3. Furthermore, Groundwater isopleths for chloride and TDS concentrations for the 2023 sampling event are shown on Figures 4 and 5, respectively. Additionally, the analytical laboratory reports are included in Appendix B.

The concentrations of chlorides and TDS are generally consistent with historical sampling events. The chloride plume has been fully delineated in the downgradient direction in both Texas and New Mexico following the installation of the 2020 monitor wells. Historical groundwater analytical results have also been provided in Appendix C.

4.4 Plume Stability

Figures 6 and 7 illustrate comparatively the isopleths of groundwater chloride concentrations (2022-2023) and total dissolved solids (TDS) concentrations (2022-2023), respectively. These figures depict the results of three groundwater monitoring events conducted using a limited well network comprising perimeter and interior source wells, as well as the comprehensive groundwater monitoring event. These figures suggest that the chloride and TDS plume is relatively stable, with the highest concentrations of chloride and TDS centered in the central portion of the plume across all the sampling events.

4.5 Quality Assurance/Quality Control

During the March 2023 sampling event, one field duplicate sample set was collected for chloride and TDS to confirm sample quality and reproducibility. No significant deviations were encountered in the sample results for duplicate constituents for either event. All certified groundwater laboratory reports received for the 2023 sampling event were reviewed by a GHD analytical chemist for laboratory and field method quality assurance/quality control (QA/QC). All laboratory reports were approved, and the associated data validation reports issued by GHD are included in Appendix D.

5. Conclusions and Path Forward

The results of the groundwater monitoring event conducted in March 2023 strongly support the stability of the chloride groundwater plume. Furthermore, GHD has firmly established its understanding of the plume's characteristics, including chloride concentrations and groundwater flow. The data collected during the March 2023 sampling event, along with the results from the sampling events in January and June 2022, as well as in July and December 2022, in conjunction with historical chloride and TDS findings, consistently indicate a persistent trend in concentrations. Based on this information, GHD is confident that the chloride plume has been delineated in the observed southwest downgradient direction.

With the conclusion of the 2023 comprehensive event, all four quarters of the agreed-upon groundwater sampling events at the Dollarhide field have been successfully completed. Scout will utilize these findings to define the extent of impacted groundwater and document the Contaminants of Concern (COCs) persisting in the groundwater. These results will be integrated into the Restrictive Covenants (RC) for each property owner within the delineated downgradient plume area, following the prescribed path forward for the Site. Currently, Scout is engaged in discussions with property owners regarding the implementation of RCs. A metes and bounds survey of the impacted property boundary to be included in the RCs will be carried out by a professionally licensed surveyor. Updates on the progress of the RCs with the relevant landowners will be provided in the fourth quarter of 2023.

In conclusion, the results of the four sampling events suggest the chloride plume is stable, and Site's hydrology and potentiometric flow are well understood. Similarly, the soil-to-groundwater exposure path from historical pit operations remains incomplete. Therefore, Scout is requesting RRC's concurrence to submit a Site Closure Request Report for the Dollarhide Oil Field Unit.

U	Analyte was not detected at or above the SDL.

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
U	Analyte was not detected at or above the SDL.

Receipt

The samples were received on 3/31/2023 9:49 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.4° C.

General Chemistry

Method SM 2540C: Reanalysis of the following sample was performed outside of the analytical holding time due to Total Dissolved Solids and conductivity out of ratio: MW-32-W-232903 (880-26624-1).

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 860-98942 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recovery was within acceptance limits.

Method 300.0: The instrument blank/CCB for analytical batch 860-98942 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Receipt

The samples were received on 3/31/2023 9:49 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.4° C.

General Chemistry

Method SM 2540C: Reanalysis of the following sample was performed outside of the analytical holding time due to Total Dissolved Solids and conductivity ratio is above 0.95: MW-28-W-232903 (880-26625-21).

Method 300.0: The instrument blank/CCB for analytical batch 860-98942 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

Method 300.0: The instrument blank/CCB for analytical batch 860-99155 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

Method 300.0: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-44-J-3-W-232903 (880-26625-5), MW-44-J-1-W-232903 (880-26625-8) and MW-44-J-2-W-232903 (880-26625-10). Elevated reporting limits (RLs) are provided.

Methods 300.0, 9056A: The following sample was diluted to bring the concentration of target analytes within the calibration range: MW-58-B-1-W-232903 (880-26625-13). Elevated reporting limits (RLs) are provided.

Method 300.0: The instrument blank/CCB for analytical batch 860-99340 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated sample(s) results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

Method 300.0: The method blank for analytical batch 860-99340 contained Chloride above the method detection limit (MDL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

The samples were received on 3/31/2023 4:39 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.5°C

HPLC/IC

Method 300_ORGFM_28D: The instrument blank/CCB for analytical batch 860-99155 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

Method 300_ORGFM_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 860-99359 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

The samples were received on 3/31/2023 4:39 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.5°C

HPLC/IC

Method 300_ORGFM_28D: The instrument blank/CCB for analytical batch 860-99155 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

Method 300_ORGFM_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 860-99155 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recovery was within acceptance limits.

Method 300_ORGFM_28D: The following samples were diluted to bring the concentration of target analytes within the calibration range: RRR-Ranch-Windmill-W-233003 (880-26667-5) and NM-MW-8-W-233003 (880-26667-7). Elevated reporting limits (RLs) are provided.

Method 300_ORGFM_28D: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-15-W-233103 (880-26667-1), MW-3-W-233103 (880-26667-2), NM-MW-2-W-233003 (880-26667-9) and NM-MW-7-W-233003 (880-26667-10). Elevated reporting limits (RLs) are provided.

Method 300_ORGFM_28D: The instrument blank/CCB for analytical batch 860-99359 contained Chloride greater than the method detection limit (MDL), and were not reanalyzed because associated sample(s) results were greater than 10X the value found in the instrument blank/CCB. The data have been qualified and reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

Method SM 2540C: Reanalysis of the following samples were performed outside of the analytical holding time due to Total Dissolved Solids and Conductivity out of ratio(<0.55 or >1.0): MW-19-W-230403 (880-26742-1), MW-20-W-230403 (880-26742-2), MW-11-W-230403 (880-26742-4), MW-25-W-230403 (880-26742-16) and MW-18-W-230403 (880-26742-23).

Method SM 2540C: Reanalysis of the following samples were performed outside of the analytical holding time due to Total Dissolved Solids and Conductivity out of ratio : MW-20-W-230403 (880-26742-2) and MW-11-W-230403 (880-26742-4).

Method 300.0: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-20-W-230403 (880-26742-2) and MW-58-B-3-W-230403 (880-26742-3). Elevated reporting limits (RLs) are provided.

Method 300.0: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-11-W-230403 (880-26742-4), MW-30-W-230403 (880-26742-5), MW-58-B-3-WD-230403 (880-26742-6), Livermore-W-230403 (880-26742-7), MW-23-W-230403 (880-26742-8), MW-31-W-230403 (880-26742-10), MW-45-E-3-W-230403 (880-26742-11), MW-13-W-230403 (880-26742-12), MW-26-W-230403 (880-26742-13), Wilson Ranch Well-W-230403 (880-26742-15), MW-25-W-230403 (880-26742-16) and MW-14-W-230403 (880-26742-19). General Chemistry

Method SM 2540C: Reanalysis of the following samples were performed outside of the analytical holding time due to Total Dissolved Solids and Conductivity out of ratio(<0.55 or >1.0): MW-19-W-230403 (880-26742-1), MW-20-W-230403 (880-26742-2), MW-11-W-230403 (880-26742-4), MW-25-W-230403 (880-26742-16) and MW-18-W-230403 (880-26742-23).

Method SM 2540C: Reanalysis of the following samples were performed outside of the analytical holding time due to Total Dissolved Solids and Conductivity out of ratio : MW-20-W-230403 (880-26742-2) and MW-11-W-230403 (880-26742-4).

Method 300.0: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-20-W-230403 (880-26742-2) and MW-58-B-3-W-230403 (880-26742-3). Elevated reporting limits (RLs) are provided.

Method 300.0: The following samples were diluted to bring the concentration of target analytes within the calibration range: MW-11-W-230403 (880-26742-4), MW-30-W-230403 (880-26742-5), MW-58-B-3-WD-230403 (880-26742-6), Livermore-W-230403 (880-26742-7), MW-23-W-230403 (880-26742-8), MW-31-W-230403 (880-26742-10), MW-45-E-3-W-230403 (880-26742-11), MW-13-W-230403 (880-26742-12), MW-26-W-230403 (880-26742-13), Wilson Ranch Well-W-230403 (880-26742-15), MW-25-W-230403 (880-26742-16) and MW-14-W-230403 (880-26742-19).
