Attention of Mr. A. L. Porter, Jr., Secretary Director

Gentlemen:

Subject: Application for Downhole Commingling
Hawk 'A' Well No. 4 - U-4-21S-37E

Continental Oil Company, Box 460, Hobbs, New Mexico, as operator of the Hawk 'A' Lease respectfully requests administrative approval under the provisions of Order No. R-3845 to commingle in the well bore production from the Drinkard and Blinebry Pools in its Hawk 'A' Well No. 4 located in Unit U of Section 4, T21S, R37E, Lea County, New Mexico. This dual completion was authorized by administrative Order No. MC-1240-A. The attached plat shows the Hawk 'A' Lease outlined in red and the No. 4 well by the red circle.

Attached hereto is a form C-116 showing the results of a test taken within the last 30 days on the Blinebry zone in this well. As shown by this test, the producing rate is 11 barrels oil, 1 barrel water and 24 MCF gas per day. The Drinkard has been shut in since 1966 and last tested no production.

The estimated bottom hole pressure of the Drinkard is 200 psi. The estimated bottom hole pressure after 24 hour shut in of the Blinebry zone, which is artificially lifted, is 995 psi based on the surface shut in pressure and the measured fluid level. The commingled production will be artificially lifted.

Attached hereto is a production decline curve for each zone. The future production from the Blinebry zone is estimated by the extension of the curve. Since the Blinebry has been artificially lifted without obstruction by a packer, we propose to allocate this zone's production on the curve extension and the remainder of the well's production to the Drinkard.

The fluid from these two pools has been commingled at the tank battery for a number of years and there has been no indication of incompatibility. Both crudes are typical Permian high gravity crude. Since

NMOCC
Hawk "A" No. 4
Page 2

the crudes have been commingled at the tank battery before sale to the pipe line, there should be no difference between the value of the commingled stream at the surface and that commingled within the well bore.

The Hawk "A" is a federal lease and a copy of this application is being furnished the U.S.G.S. and to all offset operators. Your further handling and approval of this application will be sincerely appreciated.

Yours very truly,

G. C. Jamieson
Assistant Division Manager

No well will be assigned an allowable greater than the amount of oil produced on the official test.

During gas-oil ratio test, each well shall be produced at a rate not exceeding the top unit allowable for the pool in which well is located by more than 25 percent. Operator is encouraged to take advantage of this 25 percent tolerance in order that well can be assigned increased allowables when authorized by the Commission.

Gas volumes must be reported in MCF measured at a pressure base of 15.025 psia and a temperature of 60° F. Specific gravity base will be 0.60.

Report casing pressure in lieu of tubing pressure for any well producing through casing.

Mail original and one copy of this report to the district office of the New Mexico Oil Conservation Commission in accordance with Rule 301 and appropriate pool rules.

I hereby certify that the above information is true and complete to the best of my knowledge and belief.
