RE: Request for Administrative Approval to Downhole Commingle Robert L. Bayless Jicarilla 491 #1 Unit J, Sec. 32, T28N-R2W Undesignated Pictured Cliffs, Undesignated Mesa Verde, and Undesignated Gallup Fields Jicarilla Contract #491 Rio Arriba County, New Mexico

Dear Mr. Lemay:

By this letter, we request administrative approval to commingle production from the Pictured Cliffs, Mesa Verde, and Gallup formations within the wellbore of the above captioned well.

The Jicarilla 491 #1 well was spudded by Amoco Production Company in August of 1985. A complete daily activity report for this well is presented as Attachment #1. Production casing, (7") was set and cemented at 8284 feet with PBD at 8205 feet. The Gallup interval (6848-7320) was perforated and fracture stimulated with 308,346 gallons of 30# cross-linked gelled fluid containing 287,500 lbs. of 20-40 sand. Amoco tested this zone and determined it was uneconomical. A cast iron bridge plug was set at 5925 feet.

The Mesa Verde interval was completed separately in the Point Lookout and Cliffhouse formations. The Point Lookout was perforated from 5752 to 5792 feet and fracture stimulated with 75,000 gallons of 75 quality foam containing 90,000 lbs of 20-40 sand. Amoco tested this zone and determined it was uneconomical. A cast iron bridge plug was set at 5610 feet. The Cliffhouse formation was perforated from 5492 to 5566 feet and fracture stimulated with 40,000 gallons of 75 quality foam containing 58,000 lbs. of 20-40 sand. Amoco tested this zone and determined it was uneconomical. A cast iron bridge plug was set at 3720 feet.

The Pictured Cliffs interval was completed separately in the Lower and Upper Pictured Cliffs formations. The Lower Pictured Cliffs interval

William J. Lemay, Chairman  
Page 2  
September, 1987

was perforated from 3618 to 3626 feet and fracture stimulated with 18,000 gallons of 75 quality foam containing 23,000 lbs. of 20-40 sand.

Amoco tested this zone and determined it was uneconomical. A cast iron bridge plug was set at 3550 feet. The Upper Pictured Cliffs formation was perforated from 3452 to 3496 feet and fracture stimulated with 35,400 gallons of 70 quality foam containing 41,600 lbs. of 20-40 sand. Amoco tested this zone and determined it was uneconomical. The well was then turned over to Bayless.

Bayless drilled the cast iron bridge plugs at 3550 feet, 3720 feet, 5610 feet, and 5925 feet, which opened the Pictured Cliffs, Mesa Verde and Gallup zones. The well was then cleaned up to be tested.

A 3 hour flow test was conducted on the well (all zones open) on September 9, 1987, which resulted in an AOF of 5218 MCFGPD (Attachment #2). It should be noted here that the tubing was logged off with water when this test was performed. Therefore, the test was taken on the annulus of this well. When the AOF is taken in this manner, the gas volumes will be unusually high, making the production test meaningless.

In addition to the AOF test performed on the well by Bayless, a 29 day flow test was performed on the Gallup formation by Amoco in October and November of 1985. The Gallup zone averaged 196 MCFGPD with 1.5 BOPD and 3 BWPD, for the last 14 days of the test. This test is presented as Attachment #3.

A 17 day flow test was performed on the Point Lookout formation in November and December of 1985. The Point Lookout formation averaged 140 MCFGPD and 7 BWPD for the last 7 days of the test. A 3 day flow test was performed on the Cliffhouse formation in January of 1986. The Cliffhouse formation averaged 119 MCFGPD with 16 BWPD. The combined Mesa Verde zone which includes the Point Lookout and Cliffhouse formations averages 259 MCFGPD and 23 BWPD. These tests are presented as Attachment #4.

A 1 day flow test was performed on the Lower Pictured Cliffs formation in February of 1986. The Lower Pictured Cliffs formation flowed 55 MCFGPD and 50 BWPD. A 6 day flow test was performed on the Upper Pictured Cliffs formation in February of 1986. The Upper Pictured Cliffs formation averaged 114 MCFGPD with 29 BWPD over the last 4 days of the test. The combined Pictured Cliffs zone which includes the Lower and Upper Pictured Cliffs formations averages 169 MCFGPD and 79 BWPD. These tests are presented as Attachment #5.

William J. Lemay, Chairman  
Page 3  
September, 1987

The flow test results from each zone and the fact that the tubing was logged off for the AOF test indicate that each zone has marginal gas production capabilities with significant associated water production. These tested flow rates were all performed against 50-270 psi back-pressure, while line pressures in the area can get as high as 300-400 psi. The actual gas sales production rates from each zone will be even lower against this higher backpressure, with the possibility of the backpressure stopping flow from the zone, which would result in compression expenses to re-establish the flow. The water production seen from each zone could also restrict gas production from each zone, or possibly log off the flow from the zone, as was seen in the AOF test. Logging off the well could necessitate artificially lifting this fluid, resulting in further expenditures. If commingling is granted in this wellbore, the combined zones would have a better chance of production against higher line pressures without compression and would be better able to lift the associated water production in these zones without artificial lift.

The gas produced from the Gallup, Mesa Verde, and Pictured Cliffs zones should be fairly similar in this area. The average gas gravity for these zones should be approximately 0.65 with an approximate BTU value of 1100 BTU/CFT. From the AOF test taken on this well (Attachment #2), the 1127 psi surface shutin pressure taken on the annulus of this well is a little lower than shutin pressures seen on the Mesa Verde and Gallup formations in this area. These pressures should average between 1400 and 1600 psi. The Pictured Cliffs formation should shut-in for approximately 1000 psi. This pressure data can be found in wells to the south and west of the Jicarilla 491 #1 well. It is apparent from this well and offset wells that the shutin pressures for any zone producing in this well is not less than 50% of any other zone in the well. This suggests that no significant crossflow will take place between any zones in this well.

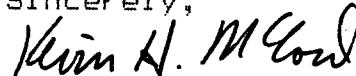

The production from the Gallup, Mesa Verde, and Pictured Cliffs zones can be allocated using the ratios of the rate of flow rate production tests performed by Amoco. Using these production tests, 31 % of the commingled gas production should be allocated to the Gallup formation, 42 % to the Mesa Verde zone, and 27 % of the gas should be allocated to the Pictured Cliffs formation. This well should produce very little oil, and what oil is produced will come from the Gallup formation. Therefore, 100% of the oil production from this well should be allocated to the Gallup formation. This allocation formula is shown in Attachment #6. The value of the gas from each zone is approximately the same, so the commingling of this natural gas will not decrease its sales value.

William J. Lemay, Chairman  
Page 4  
September, 1987

Attachment #7 is an acreage plat showing the ownership of leases in the vicinity of the Jicarilla 491 #1 well. The ownership (working interest, royalty, and overriding royalty) of the Gallup, Mesa Verde, and the Pictured Cliffs zones is common in this well. The operation of each of the spacing units around this well is either controlled by Robert L. Bayless through farmout agreements, or is unleased (open) acreage. By copy of this application, we are advising the BLM of our plans to downhole commingle the Gallup, Mesa Verde, and Pictured Cliffs zones in this well.

It is obvious from the production tests taken on the Gallup, Mesa Verde, and Pictured Cliffs zones that gas production from this well will be low, resulting in marginal gas reserves and economics for the well. The high pipeline pressures in the area could force Bayless to compress this gas to produce it, or the water produced from each zone could force more expenditures to artificially lift this produced fluid. Either or both of these expenditures could possibly be avoided by approval of downhole commingling in this well.

Sincerely,

Kevin H. McCord  
Petroleum Engineer

DAILY REPORT

- 8-18-87 Move in and rig up Bayless Rig 6. Lay flow lines. Blow down well. Nipple down Wellhead. Nipple up BOP. Trip out of hole with 2-7/8" tubing (108jts). Pick up 6-1/8" bit, bit sub, and 2-3/8" tubing. Trip in hole to bridge plug at 3550'. SDFN.
- 8-19-87 Rigged up air compressors. Drilled cast iron bridge plug at 3550' with mist. Pictured Cliffs formation providing water to mist. Trip in hole and tag bridge plug at 3720'. Drill on bridge plug at 3720' with air mist. Trip out of hole. Change out 6-1/8" bit. SDFN.
- 8-20-87 Trip in hole with new 6-1/8" bit on tubing. Drill remainder of bridge plug at 3720' with air mist. Trip in hole to bridge plug at 5610'. Drilled on plug remainder of day. Bit acting up. Trip out of hole. Bit had 1 cone missing. SDFN.
- 8-21-87 Trip in hole with mill on tubing. Mill on cone and bridge plug. Mill bridge plug at 5610' with air mist. Trip in hole to bridge plug at 5925'. (had 85 feet of sand on top of bridge plug.) SDFN.
- 8-22-87 Clean 85 feet of sand from top of bridge plug. Milled on bridge plug with air mist. Not making much progress with mill. Trip out of hole to examine mill. Mill was worn. SDFN.
- 8-23-87 SD. Sunday
- 8-24-87 Shut down. Rig repairs.
- 8-25-87 Shut down. Rig repairs.
- 8-26-87 Trip in hole with 6-1/8" bit on tubing. Drill on cast iron bridge plug at 5925'. Well started blowing from Gallup-bridge plug loose-let well blow down. SDFN.

- 8-27-87 Well blowing less. Start drilling on remainder of bridge plug. Strong gas blow died off. Bit became plugged. Tried to unplug bit. Plug would not come free. Trip out of hole. Float in bit sub damaged and plugged with shale and sand debris. Only one cone on bit was free. Wait on string float and bit. Trip in hole. Start drilling on bridge plug again. SDFN.
- 8-28-87 Drilled on bridge plug. No progress. Trip out of hole to check bit. Bit sub and bit twisted off in hole. Trip in hole with overshot. Recovered bit sub and bit. SDFN.
- 8-29-87 Trip in hole with mill on tubing. Drill remainder of bridge plug at 5925'. Well had no change in gas blowing. Tripped tubing to 7550'. (230' below Gallup perfs). Lay down 2-7/8" tubing. Trip 2-3/8" tubing in hole and land as follows:

| <u>DESCRIPTION</u>                           | <u>LENGTH</u>  | <u>DEPTH</u> |
|--|----------------|--------------|
| KB to landing point                          | 8.80           | 0-9          |
| 234 jts, 2-3/8" 4.7#/ft J-55 EUE used tubing | 7282.98        | 9-7292       |
| Seating nipple                               | .75            | 7292-7293    |
| 1 jt 2-3/8" tubing                           | 31.66          | 7293-7324    |
|  | <u>7324.19</u> |              |

Nipple down wellhead and nipple up BOP. Shut in well.  
Release rig.
