Committee Studying
Protection of
Hobbs Fresh Water
Sands

Report by Committee to Study
Contamination of Hobbs Fresh
Water Sand

Mr. H. G. Webber - Midland

Production

Hobbs

Messrs: Mr. R. H. Coe - Tulsa
H. D. Page - Tulsa
S. E. Cavanaugh - Los Angeles

Attached is copy of report from "Committee Study-
ing Protection of Hobbs Fresh Water Sands" that was
submitted to the New Mexico Oil Conservation Commission.

Mr. H. D. Page received a copy of this report on
his recent visit to Hobbs. A copy of the report was
handed to Mr. C. Melvin Neal Wednesday, October 16, 1957.

MEMORANDUM

TO: Designated Members and Alternates on
Committee Studying Fresh Water Contamination
in the Hobbs Pool Area

FROM: J. W. Brown, Acting Chairman

SUBJECT: Final Committee Report

Attached is your copy of the final draft of the Committee report. As you will recall, the Committee agreed at its last meeting on September 5, 1957, that each designated member and alternate would receive one copy (2 copies to each organization appointed to the Committee). It was also agreed that these copies would be kept confidential pending a decision by the Oil Conservation Commission as to what distribution should be made.

In accordance with the desires of the Committee, I am holding ten (10) copies of the report to be mailed to the Oil Conservation Commission on October 2, 1957, unless advised by Committee members that changes should be made in the report. Please advise me by telephone of any necessary changes. If numerous changes are suggested, it may be desirable to call another Committee meeting.

I regret that the press of other duties has delayed final preparation of this report. I take this opportunity to express my sincere appreciation to each of you for your cooperation and work in expediting the completion of the assignment given this Committee.

Shackleton

Roswell, New Mexico

MEMORANDUM

TO: New Mexico Oil Conservation Commission
Attention: Mr. A. L. Porter, Jr., Secretary-Director

FROM: Committee Studying Protection of
Hobbs Fresh Water Sands

SUBJECT: Final Report of the Committee

Transmitted herewith is the completed final report of the Committee. This report contains no direct recommendations since it is the consensus of the Committee that the need for any corrective action is adequately shown in the Committee findings. In some instances this corrective action is outside of the jurisdiction of the Oil Conservation Commission. We trust that you will arrange to have these matters brought to the attention of the appropriate persons or agencies.

It was the decision of the Committee that attendance at its meetings should be restricted to representatives of the agencies and companies appointed to the Committee, and to guest speakers specifically invited to a particular meeting. Mr. E. G. Minton, Lea County Hydrologist, was the only such speaker. The need for closed meetings was indicated by the somewhat negative results observed at the general meeting held in Hobbs on July 9, 1957.

The official representatives designated by each of the agencies and companies appointed to the Committee are listed as follows:

Pan American Petroleum Corporation
C. L. Kelley, Chairman, Roswell, New Mexico
J. W. Brown, Alternate, Roswell, New Mexico

Continental Oil Company
R. L. Adams, Member, Roswell, New Mexico
F. T. Elliot, Alternate, Hobbs, New Mexico

Hobbs City Water Board
L. A. Calhoun, Member, Hobbs, New Mexico
W. G. Abbot, Alternate, Hobbs, New Mexico

New Mexico Oil Conservation Commission
R. F. Montgomery, Member, Hobbs, New Mexico
E. J. Fischer, Alternate, Hobbs, New Mexico

Samedan Oil Corporation
C. W. Putman, Member, Hobbs, New Mexico
C. E. Layhe, Alternate, Hobbs, New Mexico

Shell Oil Company

W. E. Owen, Member, Hobbs, New Mexico
R. C. Cabaniss, Alternate, Hobbs, New Mexico

State Engineer's Office

Zane Spiegel, Member, Santa Fe, New Mexico
R. L. Borton, Alternate, Roswell, New Mexico

Tidewater Oil Company

H. P. Shackelford, Member, Hobbs, New Mexico
R. N. Miller, Alternate, Hobbs, New Mexico

Other representatives of the agencies and companies appointed to the Committee attended meetings as second alternates, served as members of subcommittees, or otherwise assisted in the work of the Committee.

R. C. Lannen
E. V. Boynton
R. J. Francis
Joe Anderson

Continental Oil Company
Continental Oil Company

Eric Engbrecht
J. W. Runyan

New Mexico Oil Conservation Commission
New Mexico Oil Conservation Commission

J. W. Montgomery

Shell Oil Company

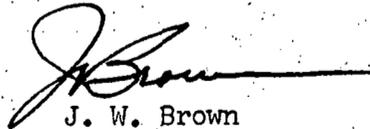

J. W. Meek

Pan American Petroleum Corporation

All of the Committee meetings were held in the Oil Conservation Commission Conference Room in Hobbs, New Mexico. The first meeting was held on July 19, 1957; subsequent all day meetings were held on July 25, August 1, August 8, August 15, August 22, and September 5. In addition to meetings of the Committee as a whole, three subcommittees held numerous meetings to complete their work assignments.

All of the agencies and companies appointed to the Committee had representatives present at each of the Committee meetings, with the exception of one meeting when one organization was unable to have a representative present.

By Committee decision the initial distribution of this final report is being restricted. In addition to the copies furnished to the Oil Conservation Commission, each designated member and alternate is to receive one copy. All have agreed to hold their copies confidential pending your decision as to the proper disposition of the report.

J. W. Brown
Acting Chairman

Confidential

FINAL REPORT OF COMMITTEE
STUDYING PROTECTION OF HOBBS
FRESH WATER SANDS
SEPTEMBER 24, 1957

At the request of the City Commission of Hobbs, New Mexico, the New Mexico Oil Conservation Commission called a meeting of all operators in the Hobbs, Bowers, and Byers-Queen Pools on July 9, 1957, in Hobbs.

During that meeting and subsequently by Mr. A. L. Porter, Jr.'s letter dated July 10, 1957, a Committee was appointed to make a study of fresh water contamination in the Hobbs Pool area and make recommendations to the New Mexico Oil Conservation Commission, as to:

1. Any action that may be taken by the Commission in addition to what is presently being done to prevent further contamination;
2. Any corrective measures that may be employed to prevent further spread of present contamination.

The Committee consisted of representatives from the following companies and agencies:

Pan American Petroleum Corporation - Chairman
Samedan Oil Corporation
Shell Oil Company
Tidewater Oil Company
Continental Oil Company
Hobbs City Water Board
State Engineer's Office
Hobbs Commission Staff

After collecting additional information regarding water wells and contamination of water wells in the Hobbs Pool area, after giving consideration to existing information and all reports of fresh water contamination, and after obtaining advice and assistance from recognized authorities on ground water and from research organizations and from texts and reports on geology and petroleum engineering, the Committee concluded its study by making numerous findings with respect to the overall problem of fresh water contamination in the Hobbs Pool area.

I. The Physical Characteristics of the Ogallala Formation and the Movement of Water Through This Aquifer.

The Committee finds:

(1) The entire Hobbs Pool area is directly underlain by the Ogallala formation of Tertiary age.

(2) The Ogallala formation in the Hobbs Pool area is an effective fresh-water aquifer with a thickness of 175'-200' of which approximately 100'-150' is saturated with water.

(3) The regional dip of the Ogallala formation is approximately 15-20' per mile in a southeasterly direction.

(4) The Ogallala formation consists largely of fine-grained sand in varying stages of cementation and consolidation. The material of the upper 5-40' is often firmly cemented by calcium carbonate to form hard dense caliche which commonly underlies the land surface in the area. The basal portion of the Ogallala is often composed of coarse sand and gravel. Thin discontinuous clay lenses are often found interbedded within the sand of the Ogallala formation. The Ogallala is underlain by Red Beds.

(5) Clay lenses and thin zones of very fine sand which are relatively well-cemented occur within the Ogallala formation. These are not continuous or of great lateral extent. The Ogallala ground-water reservoir, therefore, is unconfined and acts as a unit.

(6) Water levels in the Hobbs Pool area have declined as much as 12' since 1940 due to large withdrawals and regional drought.

(7) Water level measurements made during August, 1957, show that water levels in the Hobbs Pool area stand at from 18-65' below the land surface. In many instances this level is below the base of the caliche.

(8) The pore space in the sand of the Ogallala formation above the water table would normally contain pellicular water and air.

(9) There would be some water saturation in the sand of the Ogallala formation above the water table due to capillary forces, depending upon the physical characteristics of the sand and the thickness of sand above the water table.

(10) Pressure in the sand of the Ogallala formation above the water table would be atmospheric unless affected by outside forces.

(11) The water table in the Ogallala formation has a gradient of 15' per mile in a southeasterly direction. The water is moving at 9 to 12" per day in that direction.

(12) A negative area of influence, called a cone of depression, is developed by wells pumping water from the Ogallala formation.

(13) The vertical and lateral extent of a cone of depression is dependent upon the rate of withdrawal, duration of pumping, and the lithologic characteristics of the aquifer within the cone of depression.

(14) Ground-water mounds, or positive areas of influence, can be created by injecting water into the Ogallala formation by recharge wells.

(15) The positive areas of influence around recharge wells probably would not be large and would exist only in the area of the recharge well.

(16) The introduction of a second or third phase, oil or gas, below the water table in the Ogallala formation would cause a reduction in the relative permeability in that portion of the Ogallala sand occupied by the oil-water-gas mixture.

(17) Where both oil and gas are present below the water table, relative permeability of the sand to oil and gas would be zero if the water saturation varied from about 88% to 100%. The relative permeability of the sand to oil and gas increases as water saturation decreases below about 88%. Therefore, oil and gas in the Ogallala formation would not move until water saturation is decreased to less than about 88% of the total pore space occupied by a mixture of water-oil-gas.

(18) Oil or gas introduced into the Ogallala formation would be free to move provided only that sufficient saturation by oil or gas occurred.

(19) Once a portion of the Ogallala sand is saturated by oil or gas, it would not be possible to reduce this oil or gas saturation below about 10-12% saturation by the reduction of pressure or by moving water through the sand.

(20) Any movement of oil or gas in the Ogallala formation below the water table would result in a minimum of about 12% of the oil or gas remaining trapped in the sand through which the oil or gas moved.

(21) Oil introduced into the Ogallala formation above the water table could result in the sand tending to become oil-wet thereby resulting in residual oil saturation much higher than if introduced below the water table.

(22) Gas produced with oil is soluble to some extent in the water of the Ogallala formation, depending upon the amount of gas in contact with the water and the pressure at the point of contact.

(23) Gas dissolved in the Ogallala water would have no effect upon the movement of the water unless free gas began breaking out of the water below the water table. In such a case a reduction in the relative permeability of the sand to water would result.

(24) Dissolved gas would move with the water in a southeasterly direction at a rate of approximately 9 to 12" per day.

(25) Gravitational forces would tend to move oil or free gas in the Ogallala formation upward toward the water table.

(26) A comparison of the water wells contaminated with oil and their relationship to the structure of the base of the caliche shows that these wells are located in the structural highs while water wells contaminated with gas are located both in structural highs and lows. Refer to Exhibit No. 1 which is a map of the Hobbs Pool area contoured on the base of the caliche.

(27) The structure of the base of the caliche could possibly affect the movement of oil and gas toward structural highs. Refer to Exhibit No. 1.

II. Apparent Contaminated Conditions Which Exist in the Ogallala Formation in the Hobbs Pool Area.

The Committee finds:

(1) A total of 378 water wells were located in the area. This includes temporarily abandoned and producing wells. It is believed that this represents about 80% of the total number of water wells in the Hobbs Pool area. The majority of these wells are plotted on Exhibit No. 1.

(2) Based on tests made by Committee members, 17 water wells are suspected to be contaminated by gas. This contamination is in varying degrees, from gas contamination sufficient enough to burn with a small intermittent flame, to a slight taste. The wells are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Gibbins	SW SE NE 4-19-38	Slight Taste Gas
Easton	SW SE NE 4-19-38	Slight Taste Gas
Gackle	SE SE NE 4-19-38	Strong Taste Gas
Security Supply	NW NE NE 5-19-38	Slight Taste Gas
Ohio Oil	SE SE SE 32-18-38	Strong Taste Gas
Baker Tool	SW SE SW 32-18-38	Slight Taste Gas
Harwell	NW NE NE 28-18-38	Strong Taste Gas
Dowell	NE NE NE 28-18-38	Will Burn
Humble Oil	SW NE SW 30-18-38	Moderate Taste Gas
Bensing	NE NW NE 30-18-38	Very Slight Taste Gas

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Green	NE NE NE 30-18-38	Very Strong Taste Gas
Mertaugh	NW NE NE 30-18-38	Old Well Would Burn
Moon	NW NE NE 30-18-38	Moderate Taste Gas
Moon	SW NE NE 30-18-38	Moderate Taste Gas
Goins	NE SE NE 30-18-38	Strong Taste Gas
Ellison L-2230	SW SE NE 30-18-38	Moderate Taste Gas
Pacific Pump	NW NE NE 5-19-38	Slight Taste Gas

One of the above water wells (Ohio) is reported to have been contaminated with gas since 1930 when the nearest oil wells were more than a mile away.

The greatest degree of gas contamination was found in the Dowell (NE NE NE 28-18-38) water well. This well proved to be contaminated to such an extent that small sporadic flames of gas were observed when a lighted match was held over an opened water faucet.

(3) Of the 378 known water wells, 9 are known to have oil standing in the well bore and 3 are reported to be oil contaminated. The wells known to have oil in the well bore are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Amerada Pet.	C. N/2 29-18-38	19.4 feet
Ellison L-2230 # 1	SW NE NE 30-18-38	6.3 feet
" # 2	SE NW NE 30-18-38	0.5 feet
" # 3	SE SW NE 30-18-38	0.5 feet
" # 4	SE SW NE 30-18-38	0.8 feet
" # 5	NE SW NE 30-18-38	0.6 feet
" #11	SE NW NE 30-18-38	Trace Oil
" #12	SE SW NE 30-18-38	2.4 feet
" #13	SE SW NE 30-18-38	3.8 feet

In the case of the Ellison wells, the owner reported the presence of oil to the New Mexico Oil Conservation Commission and subsequently Commission personnel confirmed the presence of oil in the degree indicated above.

The Amerada well in which 19.4 feet of oil was found was not being produced when first inspected by Committee members. Subsequently, pumping equipment was installed and the 19.4 feet of oil was recovered. As of this date the well is pumping water and no new oil has entered the well bore. Information reported to the Committee indicates the possibility that the oil entered the well bore from the surface and not from the fresh water aquifer.

The wells reported to be contaminated by oil are located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Jackson	NE NW NW 20-18-38	Unknown
Phillips	NE NW NW 4-19-38	Unknown
Pacific Pump	NW NE NE 5-19-38	Trace

The Jackson well is reported to have oil in the well bore; however, it is the opinion of this Committee that it probably is lubricating oil from the water well pump.

(4) One well is reported to be contaminated by sewage. It is located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Phillips #6	SE NE NW 4-19-38	Unknown

(5) Forty-two wells were sampled. These samples were analyzed for chloride and sulfide content. Among these 42 water wells

are all wells that were suspected to be contaminated, the remainder being water wells near these wells. The sulfide determination did not indicate any contamination although some of the wells are known to be gas contaminated. With samples collected and analyzed by different methods, the presence of gas contamination might have been detected. A list of the wells and the results of the analysis are shown on Exhibit No. 2. Exhibit No. 3 shows the analysis of a sample collected from one of the Ellison wells during 1956 by Mr. Charles Reider, then a member of the Commission Staff.

(6) In response to the Committee's request, water analyses on 9 water wells were received from oil operators that operate water wells in the Hobbs Pool area. These analyses are included as Exhibit No. 4.

III. Feasibility of Eliminating or Removing The Apparent Contamination.

The Committee finds that there are no practical nor feasible means, now known, by which the apparent oil and gas contamination can be completely removed from the Ogallala formation for the following reasons:

(1) Evidence available gives no clear indication of the exact extent of the apparent contamination.

(2) Oil and gas contamination can exist at various depths with the same or other depths in the same area showing little or no contamination.

(3) More shallow wells evidence oil or gas contamination than deeper wells, thereby tending to confirm that oil or gas entering the Ogallala will migrate upward toward the water table.

(4) To remove oil or gas from the Ogallala, it would be necessary to flush the contaminated portion of the sand with water, draw the oil or gas into a producing water well, permit the contamination to gradually migrate or disperse, or use a combination of these methods.

(5) The combination of high withdrawal rate water wells in an area of apparent contamination encircled by recharge wells would tend to create an extended area of influence. However, the expected results in moving or flushing oil or gas would not justify the large volume of water necessary to be handled to create such an extended area of positive and negative influence.

(6) In order to decontaminate an area of oil contamination, it would be necessary to essentially remove all of the oil to prevent any further show of contamination. While it is theoretically possible to flush out the oil down to an immobile residual saturation, in practice this would be impossible.

(7) An area of gas contamination could probably be decontaminated by the use of combined high rate withdrawal and recharge wells. Even so, it would be necessary to remove gas produced with water before injecting the water in the recharge wells. Under these conditions it would be more practical to simply remove the gas from water produced for domestic purposes without a recharge program.

(8) The general and areal movement of water in the Ogallala formation in a southeasterly direction will tend to migrate or disperse the dissolved gas away from an area of apparent contamination.

IV. The Possibility of Contamination of The Hobbs City Water Supply By Migration from the Area of Apparent Contamination.

The Committee finds:

(1) Certain of the City of Hobbs water wells are located in the path of ground-water movement from the contaminated area in NE/4 30-18-38.

(2) Existing oil contamination is expected to be immobilized within the aquifer, especially in the relatively "dry" zone at the top of the aquifer, before it reaches the city wells. Further, as the city wells are completed at or near the base of the aquifer, the possibility of oil contamination has been greatly reduced.

(3) Since gas in solution may travel a great distance, certain city wells may be subject to some gas contamination in the future.

(4) Observation wells should be established and maintained between the contaminated area and the city wells.

The Hobbs City Water Board advised that the City had purchased 6 sections of water rights located 3 or 4 miles to the north and northwest of the Hobbs Pool area. These water rights are considered to be outside of any possible contamination from the Hobbs Pool area.

V. Possible Contamination of the Fresh Water in the Ogallala Formation by Sources Other Than Oil or Gas Wells Such as Sewage, Waste Oil and Acid, Open Storm Sewer Ditches, Gas Plant Waste Water, Refuse, and Oil and Oilfield Brines Held in Earthen Pits.

The Committee finds:

(1) One water well was reported to be contaminated by sewage.

(2) It was found that many service companies operating in the Hobbs Pool area are dumping waste material in earthen pits at random, thus creating a source of possible contamination. The City of Hobbs maintains a supervised pit east of the city wherein such waste can be disposed, for a nominal fee, thus eliminating this source of possible contamination to the Hobbs fresh water supply.

(3) One large storm sewer ditch exists in the southern part of the Hobbs Pool area. The depth of this ditch is such that if it does not actually penetrate the aquifer it is very close to doing so, and is considered a hazard to the underlying fresh water. Although samples of water collected from the ditch by Committee members during August, 1957, did not indicate severe contamination, the open ditch is subject to accidental severe contamination from a number of sources at any time. The analyses of two samples of water collected from the ditch are shown in Exhibit No. 5.

(4) Analyses indicate that water coming directly from the Phillips Gasoline Plant is not a potential source of contamination (196 PPM CL) but that the lake in which it accumulates is high in chlorides (3450 PPM CL). It is possible that oilfield brines are also introduced into this lake. Disposal of such brines by other means may cause the lake to become gradually lower in chlorides. See Exhibit No. 6 for more complete analyses of plant waste water.

(5) No accumulation of refuse was found that could be considered as a source of permanent contamination to the fresh water sands.

(6) It was found that numerous sources of possible contamination exist in the form of pipeline drips, tank battery burn pits, and salt water disposal pits. The latter source is expected to be eliminated in the near future after installation of proposed salt water disposal systems. Holding or disposing of oil in earthen pits is considered a possible source of contamination to the fresh water sands. This possible source of contamination can be controlled by NMOCC under existing rules and regulations.

VI. Possible Need For Rules and Regulations Governing the Drilling, Completion, and Abandonment of Water Wells in the Hobbs Pool Area.

The Committee finds:

(1) There are no rules nor regulations governing the drilling, completion, and abandonment of water wells in the Hobbs Pool area.

(2) There is a definite need for rules and regulations governing water wells to prevent further contamination of water in the Ogallala formation and to minimize the risks of producing contaminants that are now in the aquifer.

(3) Rules and regulations should, in part, govern the location, depth, casing and cementing programs, surface and sub-surface completion procedure, inspection, and abandonment of water wells.

(4) There is also a need for rules and regulations governing the drilling and abandonment of any boring or excavation that penetrates the fresh water sands.

VII. Establishment of a Water Well Observation Program To Detect Any New Contamination and to Observe the Movement, if any, of Contamination from the Area Northwest of Hobbs.

The Committee finds:

(1) At least 42 water wells, and probably more, are available for observation purposes in the Hobbs Pool area. Exhibit No. 7 is a tabulation listing these wells according to their location and accessibility to water level measurements and to water sample collection.

(2) As much information as possible should be collected regarding the potential observation wells. Such information should ideally include the driller's log, date drilled, depth, casing program, location of any perforations, and an accurate description of the well location.

(3) An effective network of observation wells can be established by evaluating the potential observation wells with regard to their location within the Hobbs Pool area and to information available regarding their completion.

VIII. The Possibility of, and Methods for, Obtaining Potable Water From the Areas of Apparent Contamination.

The Committee finds:

(1) It should be possible to obtain potable water at almost any location in the Hobbs Pool area provided that proper depth is penetrated, proper methods used to complete the water well, and reasonable caution is used in locating the well with respect to nearby possible sources of contamination.

(2) Since most contamination by oil and gas is evidenced in shallow wells, and since oil and gas will tend to migrate upward toward the water table, it would be advisable to complete water wells as deep as possible in the Ogallala, cement casing to the completion depth, seal around the top of the casing at the surface, and have the casing extend above the natural ground level.

(3) Since some evidence indicates that various depths may be contaminated, casing should be cemented so that shallower intervals can be tested if contamination is found in deeper intervals.

(4) If a water well in the Hobbs Pool area evidences contamination by oil and/or gas, this water can be made potable by removing the oil at the surface by a simple skimming or settling process. Gas can be removed by aeration. If gas contamination is severe, it might be necessary to flow the water over several cascade type trays with a layer of activated charcoal in the bottom of each. This charcoal should not require frequent replacement. If a disagreeable odor or taste of hydrogen sulfide remains a few PPM of chlorine added to the water should remove the odor and taste. Water from gas contaminated wells produced directly into and held in pressure tanks will retain gas in solution to be released when water is withdrawn.

IX. Causes of Oil and Gas Well Casing Deterioration.

The Committee finds:

Oil Conservation Commission records indicate that to this date defective casing has been repaired at 63 Hobbs Pool wells. There are numerous causes of this deterioration of casing in oil and gas wells. Some of these causes are listed as follows:

(1) Corrosive conditions are known to exist in the Hobbs Pool which can cause leaks in any casing string subjected to these conditions.

(2) Severe internal casing corrosion can result from the presence of hydrogen sulfide contained in gas produced with the Hobbs crude oil.

(3) External or internal casing corrosion can result from electrolytic action, action of sulfate reducing bacteria, or galvanic action.

(4) Stress concentrations resulting from even mild corrosion can cause failures of the well casing.

(5) Wear between the tubing and casing in pumping wells as is caused by the movement of tubing during the pumping cycle can cause casing leaks.

(6) Pressure in formations behind the casing can cause collapse of the casing.

(7) Casing will be subjected to continued high pressure from the producing formation throughout the foreseeable future. Hobbs Pool bottom hole pressures averaged 986 psig in 1954 and 941 psig in 1956, indicating very gradual decline. With continued high pressure on the casing and considering the age of the remaining Hobbs Pool wells where casing has not been repaired, the instance of casing leaks may be expected to increase during the 20-30 years remaining life of the pool.

X. Methods of Preventing or Minimizing Oil and Gas Well Casing Deterioration.

The Committee finds that there are numerous means and materials available to the oil industry by which oil and gas well casing deterioration can be minimized or eliminated. Some of these means and materials are listed as follows:

- (1) Coatings applied to the interior and/or exterior of casing.
- (2) Numerous and various chemicals injected into oil and gas wells to minimize corrosive attack.
- (3) Induced electrical current or elimination of electrical current to minimize electrolytic corrosive attack.
- (4) Spotting chemically treated mud outside of casing or circulating cement outside of casing to prevent corrosive attack by sulfate reducing bacteria.
- (5) Setting packers in the casing in or above the producing formation and filling the annular space above the packer with non-corrosive liquid.
- (6) Circulating cement between strings of casing.
- (7) Using anchors or guides to prevent tubing-on-casing wear.

XI. Methods of Determining the Existence of Defective Casing.

The Committee finds that there are numerous methods available by which defective casing can be detected. Some are listed as follows:

- (1) Internal caliper surveys to gauge the extent, depth and location of corrosive attack on the internal string of casing.
- (2) Temperature surveys to locate temperature anomalies which are possible indications of casing leaks.
- (3) Hydraulic pressure tests using packers to determine if a leak exists and to locate the leak.
- (4) Potential profile surveys to determine the probability of external casing corrosion and thereby the likelihood of casing leaks.
- (5) Bradenhead pressure surveys to determine by pressure observations on the several casing strings the possible existence of casing leaks.
- (6) Chemical analysis of produced water as an indication of a casing leak through the presence of foreign water.

(7) Lack of normal clearance between tubing and casing as an indication of possible casing collapse or of parted casing.

(8) Any observed abnormal performance of the well with respect to bottom hole pressure, gas-oil ratio, water production, or oil production.

(9) Unusual performance or presence of foreign liquid or gas in shallower oil, gas, or water wells in the vicinity.

(10) Electrical logs, permeability surveys, and radioactive tracer surveys to locate leaks or parted casing.

The method or combination of methods best adapted for any particular well will depend upon the conditions which exist at each individual well. The bradenhead pressure survey is least expensive, quicker, and very effective under proper conditions.

XII. Methods of Repairing Oil and Gas Well Casing Found to be Defective.

The Committee finds that there are numerous means by which casing can be effectively repaired. The method to be used will depend upon the conditions which exist at the individual well. Some of these methods are as follows:

(1) Recover the entire casing string found to be defective and run and cement an entirely new casing string.

(2) Run and cement a full string of smaller casing inside the defective casing.

(3) Recover that portion of the casing string found to be defective, replace casing, and re-run casing string using casing bowl overshot or other method to tie back on to and seal with casing left in the hole.

(4) Run and cement a liner covering that portion of the casing found to be defective.

(5) Circulate cement to the surface between casing strings during completion or repair operations.

(6) Squeeze cement through casing leaks and obtain a solid final build up squeeze pressure.

XIII. Programming of Bradenhead Pressure Tests on Oil and Gas Wells in the Hobbs Pool Area.

The Committee finds:

(1) Bradenhead pressure surveys, where the several casing strings are open for pressure measurement, should indicate whether or not a casing leak exists and therefore the possibility of fresh water sand contamination at the well being tested.

(2) Bradenhead pressure surveys conducted annually are too infrequent to provide adequate warning of possible contamination of the fresh water sand.

(3) Bradenhead pressure surveys conducted quarterly should provide more adequate warning of possible contamination of the fresh water sand.

(4) It should be necessary for the NMOCC to witness only one of the quarterly bradenhead pressure surveys each year.

(5) The operators of the individual wells should conduct the other three surveys, recording and saving the test results, and filing a certification with NMOCC that all wells operated by that operator have been tested and whether or not leaks were found.

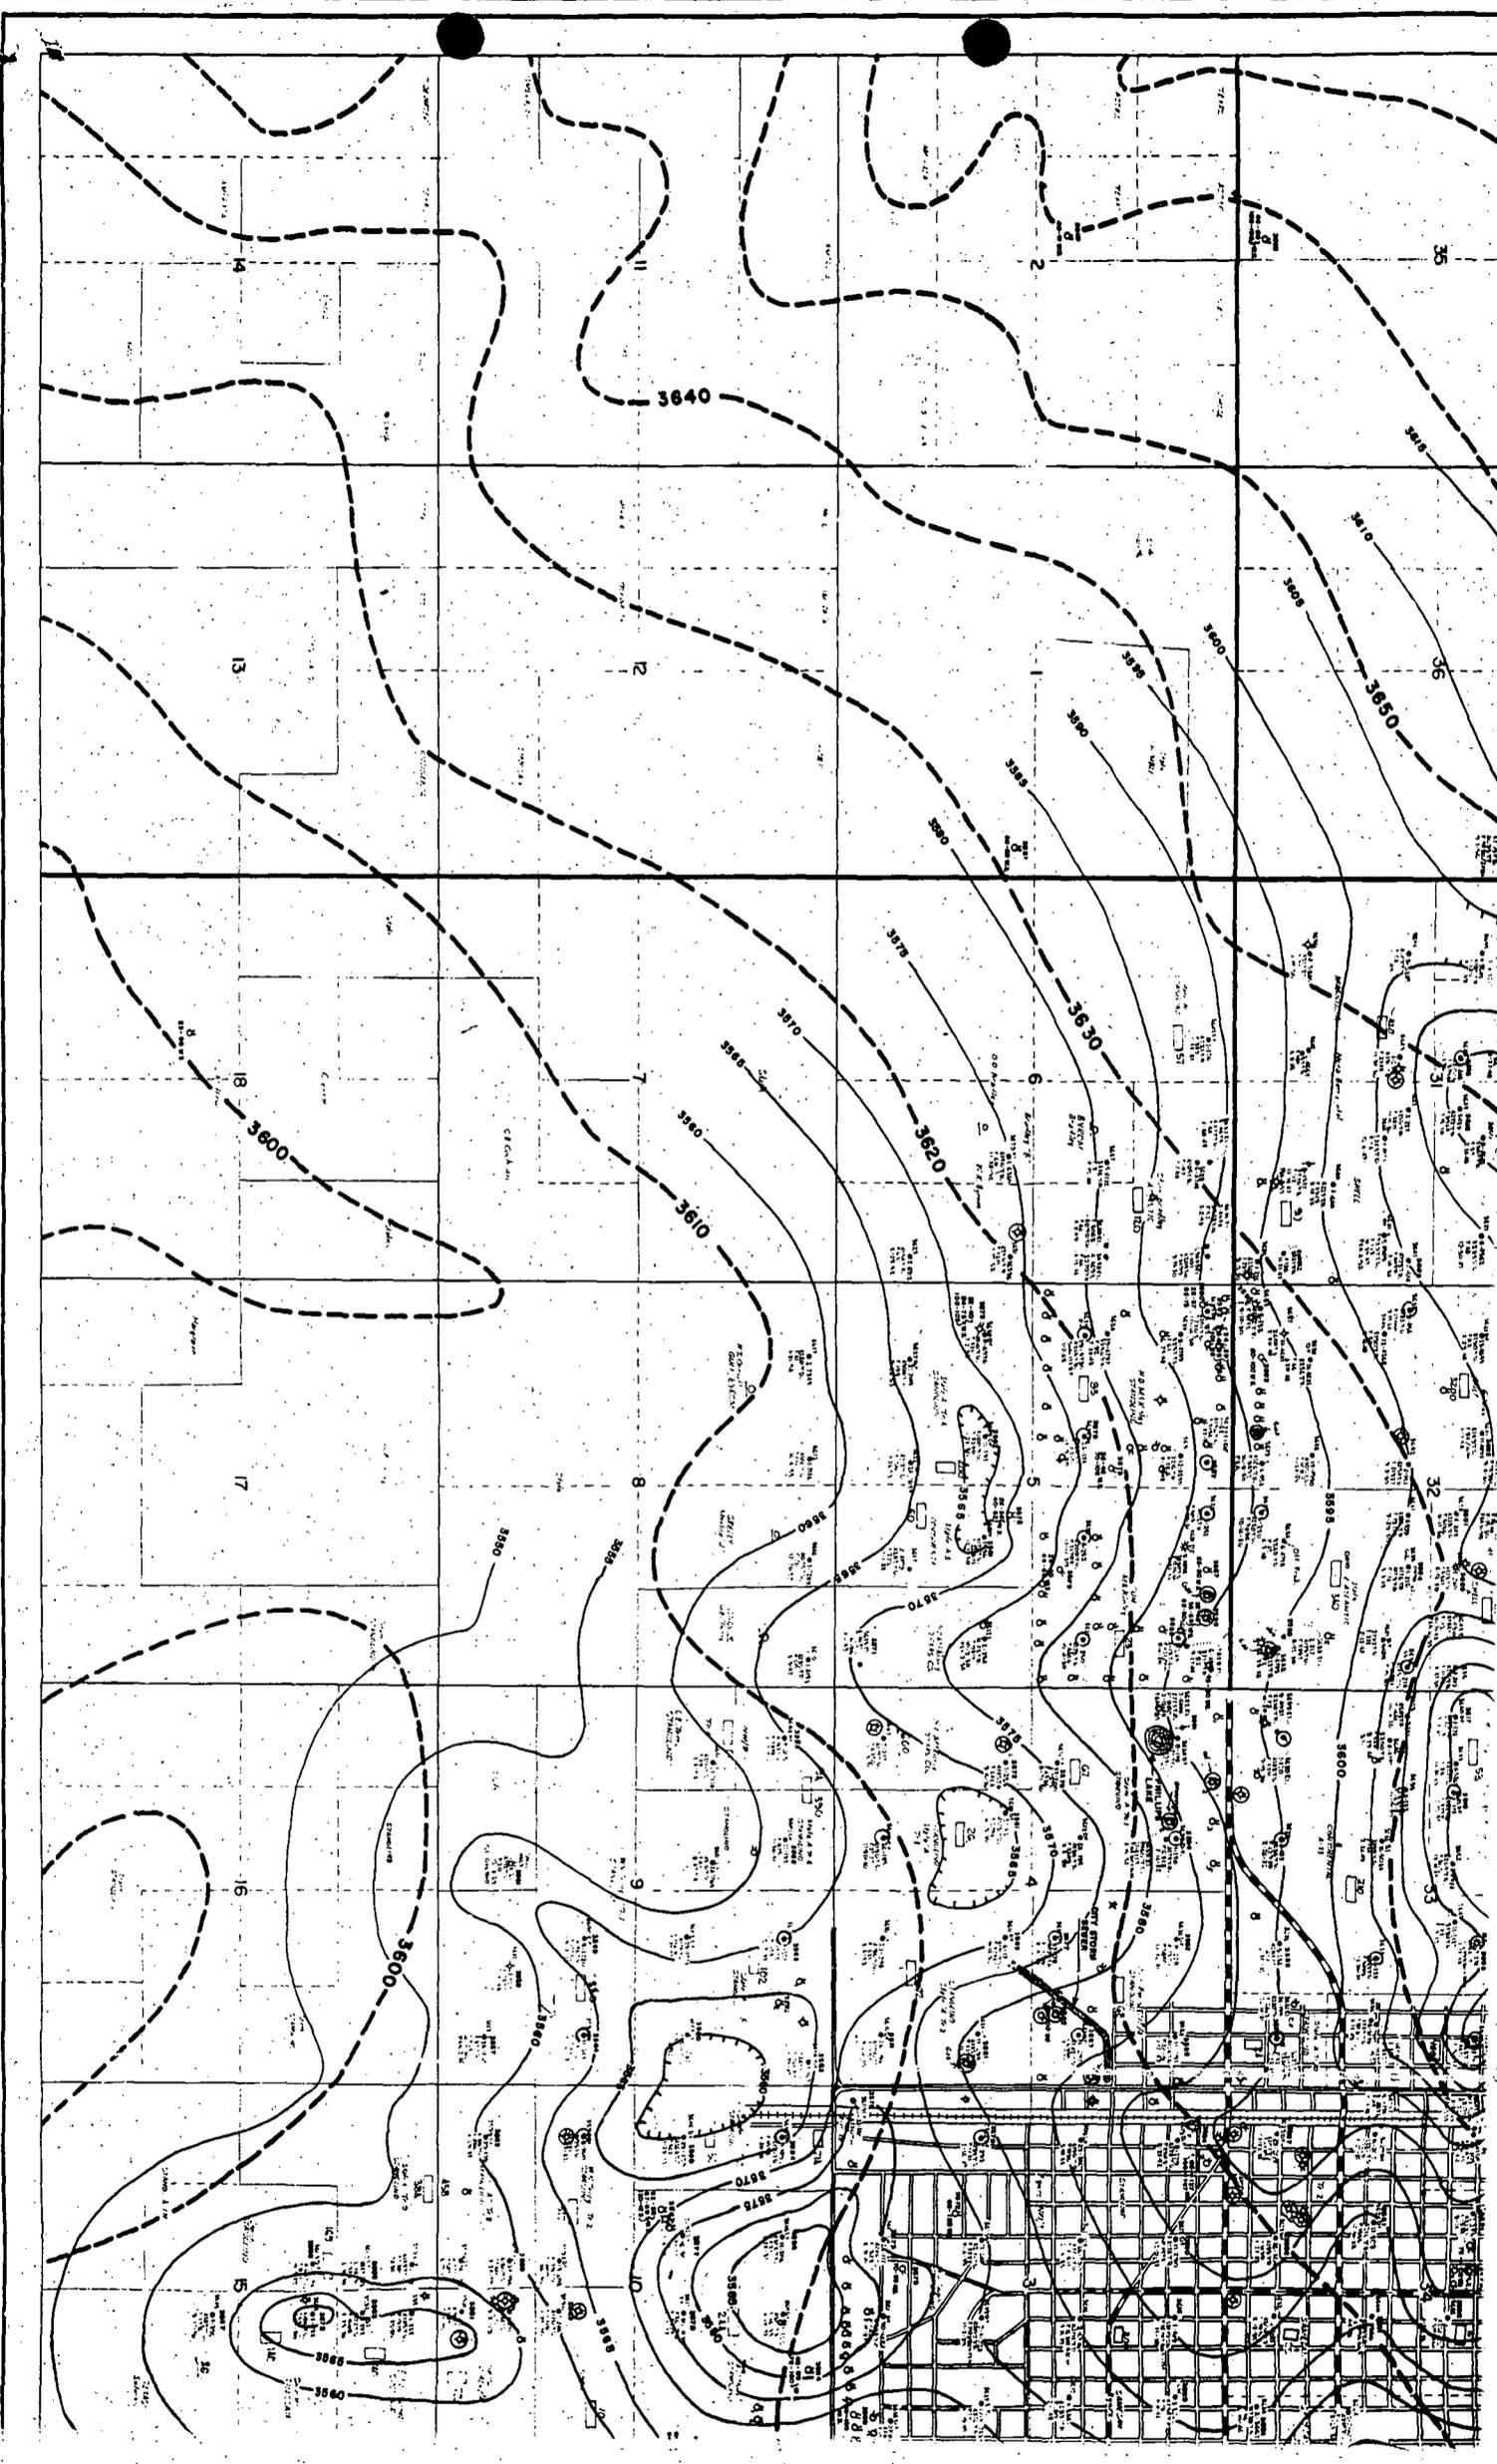

(6) All producing oil and gas wells, abandoned wells, temporarily abandoned wells, and salt water disposal wells, should be scheduled for the quarterly bradenhead surveys.

(7) There are a number of old oil wells in the Hobbs Pool area with the intermediate casing set on open surface casing with clamps, thereby preventing pressure observation. Such open surface casing is a possible source of fresh water sand contamination since the top of the surface casing is in the bottom of cellars. In order to obtain valuable information during bradenhead pressure surveys and to eliminate one possible source of contamination, the top of the annular space between the clamped intermediate casing and the surface casing should be sealed and vented to the surface.

*DOWELL, Gas in line and spurting as sample was taken	NE SE NE 30-18-38	8-22-57	80

*Contained sulfide present as ferrous sulfide in trace quantity. No free hydrogen sulfide was found in this sample nor in any of the other samples listed above.

With samples collected and analyzed by different methods, the presence of gas contamination might have been detected.

EXHIBIT NO. 3

ANALYSIS OF SAMPLE
FROM ELLISON WELL
AUGUST, 1956

Air and Water	95.37%
Methane	2.30%
Ethane	0.15%
Propane	0.49%
CO ₂	1.49%
Butane (plus)	0.14%
H ₂ S	0.06%

Analysis made by Permian Basin Pipeline using Mass Spectrometer. Sample collected by Mr. Charles Reider, then a member of the Commission Staff.

EXHIBIT NO. 5

ANALYSIS OF WATER SAMPLES
FROM LARGE STORM SEWER DITCH

The chloride and sulfide content of the two water samples, each designated "open sewer, Hobbs, New Mexico", submitted August 21, 1957, was negligible. Both samples gave a negative Endo Agar Test, indicating they were free of fecal contamination. They contained organic matter, both dissolved and in suspension, and considerable dissolved iron. The sodium, potassium, and calcium content was 12, 4, 24 and 9, 4, 28 parts per million, respectively.

EXHIBIT NO. 6

ANALYSIS OF WASTE WATER

Phillips Gasoline Plant

Sample No. 1 - Waste water direct from plant
Date Collected - 8/6/57

Phenolphthalein end point = 550 ppm
Methyl orange (M-orange) = 620 ppm
Total hardness = 0
Chlorides = 196 ppm
Ph = 11.55
Orthophosphate = 45 ppm
Hydrogen sulfide = 0 ppm

Not considered potable but is soft. Will not scale.

Sample No. 2 - Waste water from large pit behind
Phillips Plant

Date Collected - 8/6/57
Algae growth moderate

Phenolphthalein end point = 0 ppm
Methyl orange (M-orange) = 196 ppm
Total hardness = 1700 ppm
Chlorides = 3450 ppm
Ph = 7.55
Orthophosphate = 20 ppm
Hydrogen sulfide = 0 - 1.7 ppm

Not considered potable due to hardness and chlorides.

Lawsuit Filed For \$200,000

Suit for more than \$200,000 is on file in district court against a movie theater organization in connection with the May 11 drowning of Tony Allen Glasspoole of Hobbs.

The 8-year-old son of Mr. and Mrs. Robert A. Glasspoole was drowned in a rain-filled pit near the Flamingo Drive-In Theater, while attempting to float on a raft in it. The plaintiff's through their attorney, Joseph O. Walton, ask \$150,000 plus \$50,000 in punitive and \$682.30 in actual damages in the case.

Filed against Video Independent Theaters Inc., All States Theaters Inc. and Eagle Drive-In Inc., the suit alleges that the pit "was an attractive nuisance or constituted a concealed danger in the nature of a trap which the defendants knew, or should have known, existed and which was attractive to children of tender years"

The pit is described in the complaint as about 200 feet long and about 30 feet deep. The plaintiffs contend that it is "neither adequately fenced nor posted to warn against the hazards thereof. . . ."

The complaint also contends that the pit, about 500 feet from a public highway, was "in a community where many children of tender years lived and approximately 35 of whom were of school age and boarded a school bus within the near vicinity of said pit. . . ."

The Glasspoole child and two others, aged 4 and 6 years, allegedly were playing in the pit at the time when the boy was drowned.

The Flamingo theater is about a mile north of the Hobbs city limits, on the Denver City Highway.

SIXTH MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
SEPTEMBER 5, 1957

The sixth and last meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OGC Conference Room in Hobbs, New Mexico, on September 5, 1957. Official representatives present and taking part in the meeting were as follows:

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
Joe Anderson, Alternate	Continental Oil Company
L. A. Calhoun, Member	Hobbs City Water Board
R. F. Montgomery, Member	New Mexico Oil Conservation Commission
E. J. Fischer, Alternate	New Mexico Oil Conservation Commission
G. W. Putman, Member	Samedan Oil Corporation
R. E. Layne, Alternate	Samedan Oil Corporation
R. C. Cabaniss, Alternate	Shell Oil Company
R. L. Borton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company

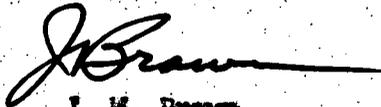

The meeting was called to order at 9:30 a.m. by J. W. Brown, Acting Chairman.

Final reports were heard from subcommittees.

The major portion of the meeting was devoted to a review of a draft of the final report. Agreement was reached as to the contents, form, and distribution of the final report.

No other meetings of the Committee are planned.

The meeting was adjourned at 3:00 p.m.

Mr. H. G. Wesberry - Midland
Mr. Jack Jones - Tulsa

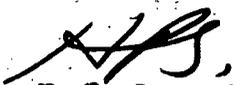

August 26, 1957

Fourth meeting of "Committee to Study Protection of Hobbs Fresh Water Sands" met Thursday, August 22, 1957 at 9:00 A.M. in the New Mexico Conservation Commission conference room. Mr. J. W. Brown, Pan American Petroleum Corporation, presided. Representatives from Continental Oil Company, Samedan Oil Company, Shell Oil Company, Tidewater Oil Company, Hobbs City Water Board, New Mexico Oil Conservation Commission and State Engineers office were present.

Firms selected to work out the various findings of the committee, discussed their results.

The Hobbs City Water Board and the OCC reported on "Apparent Contamination Conditions which exist in the Ogallala formation northwest of the city of Hobbs." Attached are their findings.

A water well, on Amerada's lease, located in center of north half of Sec. 29, 18S, 38E, was found to contain oil. The well was last checked in 1953. Amerada pumped this well and recovered about 3 bbls. oil, rest water. This well is about 1/4 mile west of Tidewater's Grimes lease.

Attached is a news item which appeared in the Hobbs
Daily News-Sun, August 25, 1957.

The one thing that I thought very interesting was
the manner in which Mr. Joseph Walton (attorney for
Mr. Ellison, who is suing for oil in his water well on
Getty Oil Company's McKinley lease) completed his water
well. He certainly didn't advise Mr. Ellison to complete
his in a like manner when trying to get water on the
McKinley lease. (I do not think they were really looking
for water on the McKinley lease.)

I thought this might be of some interest to you.

H. P. Shackelford

Enclosure

IT'S A GUSHER—A water gusher, that is, at the site of the "Green Meadows" development under way by Joseph Walton of Hobbs, shown here inspecting the well. The well flowed 1,100 gallons of water a minute in testing operations yesterday. Water from it will be used to fill a fishing and boating lake, first to be 10 acres in size but later to be expanded to 25 acres. The lake and other developments will be on an 80-acre tract north of Hobbs. News-Sun photo by Jim Rawls.

Recreation Project Planned for Hobbs

Development of an area scheduled eventually to include a 25-acre lake, a large motel, swimming pool, trailer park, restaurant and service station is under way on an 85-acre tract north of Hobbs.

Testing of a well that will supply water for the lake is under way this weekend, Joseph O. Walton, owner and developer of the project, said. First phase of the undertaking will be a 10-acre lake which is to be stocked with bluegill, bass and catfish.

The lake is due to be open for fishing this fall.

Site of the development is an area east of State Road 18, about two miles north of Hobbs. The front of the area joins a roadside park there.

Both the original lake and the section to be added later are in natural shallow lakebeds which will be deepened. Dirt is being removed now from the first of the two sites.

Name of the project, Walton said will be "The Green Meadows."

The entire area will be landscaped, Walton said, with trees and shrubs. Also to be included are picnic grounds and barbecue pits.

The motel is planned as a 50-unit installation, opening onto a

v/enal.

Two Firms Sued For Oil and Gas Allegedly in Water

Suit was filed against the Tidewater and Getty Oil Companies today, asking \$27,500 damages in connection with alleged pollution of water near the north city limits of Hobbs.

Plaintiff in the suit is W. H. Ellison. The suit seeks \$15,000 in actual damage, \$2,500 for expenses and \$10,000 in punitive damage.

Ellison, in the suit, contends through attorneys Joseph O. Walter and W. D. Girard that the water under his holdings has "become so polluted with oil and gas and other deleterious substances from the wells of the defendants that said water has become useless and harmful for the said domestic or irrigational uses."

Ellison's home, about two miles west of the Lovington highway and a half-mile south of West Bender, is on a tract of about five acres. The land and water wells figured in the recent hearing held here by the Oil Conservation Commission in connection with the possible pollution of city water supplies.

The Ellison property was included on a tour by OCC, city and oil industry officials in connection with the hearing, which had been requested by the Hobbs city commission.

The hearing was asked after a city commission meeting in which possible pollution of water was discussed extensively. The commission expressed fear that contamination of city water supplies might result from casing leaks in oilwells near water wells.

The suit was to be filed by District Court Clerk W. M. (Billy) Beauchamp today.

In the complaint the Ellison attorneys allege that Ellison holds water permits allowing him to irrigate up to 2½ acres of land each year and that the defendants have caused and permitted the continued pollution of said water in violation of the rules and regulations of the Oil and Gas Conservation Commission of the state of New Mexico, against statutory provisions of the laws of the state of New Mexico, and contrary to the criminal provisions of the statutes of the state of New Mexico.

The defendants have, the complaint alleges, "knowingly permitted the conditions to exist, as above described, and have under the laws of the state of New Mexico created a nuisance which they have not attempted to abate and are not at this time attempting to abate and that said pollution is knowingly and intentionally being permitted to continue."

The complaint contends that Ellison has attempted to erect his permanent abode on the land but has been forced to haul in all drinking water and water for family purposes, and that he "has had to abandon one well and drill another seeking potable water and in further efforts to obtain potable water he has drilled some 13 additional wells without success insofar as pertains to his property."

FIFTH MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
AUGUST 22, 1957

The fifth meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OCC Conference Room in Hobbs, New Mexico, on August 22, 1957. Official representatives present and taking part in the meeting were as follows:

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
R. J. Francis, Alternate	Continental Oil Company
R. F. Montgomery, Member	New Mexico Oil Conservation Commission
E. J. Fischer, Alternate	New Mexico Oil Conservation Commission
R. E. Layhe, Alternate	Samedan Oil Corporation
R. C. Cabaniss, Alternate	Shell Oil Company
J. W. Montgomery, Alternate	Shell Oil Company
R. L. Borton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company
Others present:	
Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Runyan	New Mexico Oil Conservation Commission

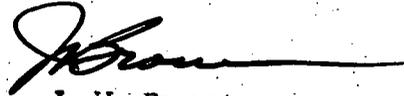

The meeting was called to order at 9:15 a.m. by J. W. Brown, Acting Chairman.

Reports were heard from the two sub-committees which had not completed their assignments.

Major portion of the meeting was devoted to the preparation of the Committee's final report. Draft copies of items to be included in the final report were reviewed in detail by the Committee.

The next meeting was scheduled to be held at 9:00 a.m. in
the OGC Conference Room in Hobbs on September 5, 1957.

The meeting was adjourned at 3:45 p.m.

I The Physical Characteristics of the Ogallala Formation and the Movement of Water Through This Aquifer.

The Committee finds as follows:

- (1) The entire Hobbs Pool Area is directly underlain by the Ogallala formation of Tertiary age.
- (2) The Ogallala formation, in the Hobbs Pool Area, is an effective fresh-water aquifer with a thickness of 175-200' of which approximately 100-150' is saturated with water.
- (3) The regional dip of the Ogallala formation is approximately 15-20' per mile in a southeasterly direction.
- (4) The Ogallala formation consists largely of fine-grained sand in varying stages of cementation and consolidation. The material of the upper 5-40' is often firmly cemented by calcium carbonate to form hard dense caliche which commonly underlies the land surface of the area. The basal portion of the Ogallala is often composed of coarse sand and gravel. Thin discontinuous clay lenses are often found interbedded within the sand of the Ogallala formation.
- (5) Clay lenses and thin zones of very fine sand which are relatively well-cemented occur within the Ogallala formation. These are not continuous or of great lateral extent. The Ogallala ground-water reservoir, therefore, is unconfined and acts as a unit.
- (6) Water levels in the Hobbs Pool area have declined as much as 12' since 1940 due to large withdrawals and regional drought.
- (7) Water level measurements made during August, 1957, show that water levels in the Hobbs Pool Area stand at from 18-65' below the land surface. In many instances this level is below the base of the caliche.
- (8) The pore space in the sand of the Ogallala formation above the water table would normally contain pellicular water and air.
(interstitial)
- (9) There would be some water saturation in the sand of the Ogallala formation above the water table due to capillary forces, depending upon the physical characteristics of the sand and the thickness of sand above the water table.
- (10) Pressure in the sand of the Ogallala formation above the water table would be atmospheric unless affected by outside forces.
- (11) The water table in the Ogallala formation has a gradient of 15' per mile in a southeasterly direction. The water is moving at 9 to 12" per day in that direction.
- (12) A negative area of influence, called a cone of depression, is developed by wells pumping water from the Ogallala formation.
- (13) The vertical and lateral extent of a cone of depression is dependent upon the rate of withdrawal, duration of pumping, and the lithologic characteristics of the aquifer within the cone of depression.

(14) Ground-water mounds, or positive areas of influence, can be created by injecting water into the Ogallala formation by recharge wells.

(15) The positive areas of influence around recharge wells probably would not be large and would exist only in the area of the recharge well.

(16) The introduction of a second or third phase, oil or gas, below the water table in the Ogallala formation would cause a reduction in the relative permeability in that portion of the Ogallala sand occupied by the oil-water-gas mixture.

(17) Where both oil and gas are present below the water table, permeability of the sand to water would be zero if the oil and gas saturation varied from 100% down to 70%. (The permeability of the sand to water increases as oil and gas saturation decreases below 70%). [Therefore, water in the Ogallala formation would not move until oil or gas saturation is decreased to less than 70% of the total pore space occupied by a mixture of water-oil-gas.]

(18) Oil or gas in the Ogallala formation below the water table would not move until oil or gas saturation increased above about 12% of the total pore space occupied.

(19) Oil or gas introduced into the Ogallala formation would be free to move provided only that sufficient saturation by oil or gas occurred.

(20) Once a portion of the Ogallala sand is saturated by oil or gas, it would not be possible to reduce this oil or gas saturation below about 12% saturation by the reduction of pressure or by moving water through the sand.

(21) Any movement of oil or gas ^{about} in the Ogallala formation below the water table would result in a minimum of 12% of the oil or gas remaining trapped in the sand through which the oil or gas moved.

(22) Oil introduced into the Ogallala formation above the water table could result in the sand becoming oil-wet thereby resulting in residual oil saturation much higher than if introduced below the water table.

(23) Gas produced with oil is soluble to some extent in the water of the Ogallala formation, depending upon the amount of gas in contact with the water and the pressure at the point of contact.

(24) Gas dissolved in the Ogallala water would have no effect upon the movement of the water unless free gas began breaking out of the water below the water table. In such a case a reduction in the relative permeability of the sand to water would result.

(25) Dissolved gas, ~~but not oil~~, would move with the water in a southeasterly direction at a rate of approximately 9 to 12" per day.

(26) Gravitational forces would tend to move oil or ^{free} gas in the Ogallala formation upward to the water table.

(27) A comparison of the water wells contaminated with oil and their relationship to the structure of the base of the caliche shows that these wells are located in structural highs while water wells contaminated with gas are located both in structural highs and lows.

(28) The structure of the base of the caliche could possibly affect the movement of oil and gas toward structural highs.

II Apparent Contaminated Conditions which Exist in the Ogallala Formation in the Hobbs Pool Area.

1. A total of 378 water wells were located in the area. *It is believed that this represents about 80% of the total number of water wells located in the Hobbs Pool Area. This includes 74 producing wells.*

2. Seventeen water wells are ^{reported} ~~thought~~ to be contaminated by gas. *Based on taste tests by Com. Members the following 17 water wells are sus to be contaminated by gas in varying degrees.*
They are located as follows:

Gibbins	SW SE NE 4, 19-38
Easton	SW SE NE 4, 19-38
Gackle	SE SE NE 4, 19-38
Security Supply	NW NE NE 5, 19-38
Ohio Oil	SE SE SE 32, 18-38
Baker Tool	SW SE SW 32, 18-38
Harwell	NW NE NE 28, 18-38
Dowell	NE NE NE 28, 18-38
Humble Oil	SW NE SW 30, 18-38
Bensing	NE NW NE 30, 18-38
Green	NE NE NE 30, 18-38
Mertaugh	NW NE NE 30, 18-38
Moon	NW NE NE 30, 18-38
Moon	SW NE NE 30, 18-38
Goins	NE SE NE 30, 18-38
Ellison, L-2230	SW SE NE 30, 18-38

One water well (Ohio Oil, SE SE SE 32, 18-38) is reported to have been contaminated with gas since 1930.

One water well (Dowell, NE NE NE 28, 18-38) proved to be contaminated to such an extent that sporadic flames of gas were observed when a lighted match was held over an opened water faucet.

3. Of the 378 known water wells, 9 are known to be contaminated by oil and 3 are reported to be contaminated by oil. The wells known to be contaminated by oil are located as follows:

Amerada Petroleum	C N/2	29, 18-38
Ellison, L-2230, No. 1	SW NE NE 30,	18-38
" 2	SE NW NE 30	"
" 3	SE SW NE 30	"
" 4	SE SW NE 30	"
" 5	NE SW NE 30	"
" 11	SE NW NE 30	"
" 12	SE SW NE 30	"
" 13	SE SW NE 30	"

The wells reported to be contaminated by oil are located as follows:

Jackson	NE NW NW 20, 18-38
Phillips	NE NW NW 4, 19-38
Pacific Pump	NW NE NE 5, 19-38

The amount of oil observed to be present in the well bores of the nine contaminated wells ranged from 0.5 inches to 19.4 feet.

4. One well is reported to be contaminated by sewage. It is located as follows:

Phillips #6	SE NE NW 4, 19-38
-------------	-------------------

114

Feasibility of Eliminating or Removing the Apparent Contamination.

The Committee finds that there are no practical nor feasible means, now known, by which the apparent oil and gas contamination can be completely removed from the Ogallala formation for the following reasons:

1. Evidence available gives no clear indication of the exact extent of the apparent contamination.
2. Oil and gas contamination can exist at various depths with the same or other depths in the same area showing little or no contamination.
3. More shallow wells evidence oil or gas contamination than deeper wells, thereby tending to confirm that oil or gas entering the Ogallala will migrate upward toward the water table.
4. To remove oil or gas from the Ogallala, it would be necessary to flush the contaminated portion of the sand with water, draw the oil or gas into a producing water well, permit the contamination to gradually migrate or disperse, or use a combination of these methods.
5. The combination of high withdrawal rate water wells in an area of apparent contamination encircled by recharge wells would tend to create an extended area of influence. However, the expected results in moving or flushing oil or gas would not justify the large volume of water necessary to be handled to create such an extended area of positive and negative influence.
6. In order to decontaminate an area of oil contamination, it would be necessary to essentially remove all of the oil to prevent any further show of contamination. While it is theoretically possible to flush out the oil down to an immobile residual saturation, in practice this would be impossible.
7. An area of gas contamination could probably be decontaminated by the use of combined high rate withdrawal and recharge wells. Even so, it would be necessary to remove gas produced with water before ~~re~~injecting the water in the recharge wells. Under these conditions it would be more practical to simply remove the gas from wells furnishing water for domestic purposes without a recharge program.
8. The general and areal movement of water in the Ogallala formation in a southeasterly direction will tend to migrate or disperse the dissolved gas away from an area of apparent contamination.

IV The Possibility of Contamination of the Hobbs City Water Supply by Migration from the Area of Apparent Contamination.

^{certain.}
1. The City of Hobbs water wells are located in the path of ground-water movement from the contaminated area in NE/4 30, 18-38.

2. Existing oil contamination is expected to be immobilized within the aquifer, especially in the relatively "dry" zone at the top of the aquifer, before it reaches the city wells. Further and add (A)

~~3. As gas in solution may possibly travel a great distance, the city wells are in some danger of gas contamination in the future.~~ ^{certain}
~~may possibly show~~

~~4. As the city wells are completed at or near the base of the aquifer, the possibility of oil contamination has been greatly reduced.~~

4. Observation wells should be established and maintained between the contaminated area and the city wells.

may be subject to some gas contamination in the future.

V Possible Contamination of the Fresh Water in the Ogallala Formation by Sources other Than Oil or Gas Wells such as Sewage, Waste Oil and Acid, Open Storm Sewer Ditches, Gas Plant Waste Water, Refuse, and Oil and Oilfield Brines Held in Earthen Pits.

The Committee finds as follows:

1. One water well was reported to be contaminated by sewage.

2. It was found that many service companies operating in the Hobbs Pool Area are dumping waste oil and acid in earthen pits at random, thus creating a source of possible contamination. The City of Hobbs maintains a supervised pit east of the city wherein such waste can be disposed, for a nominal fee, thus eliminating this source of possible contamination to the Hobbs fresh water supply.

3. One large storm sewer ditch exists in the southern part of the Hobbs Pool Area. The depth of this ditch is such that if it does not actually penetrate the aquifer ~~it~~ is very close to doing so. The unsupervised dumping of various waste products into this ditch is a definite hazard to the underlying fresh water. Three wells adjacent to ~~this pit~~ ^{an additional} are reported to be contaminated.

4. Analyses indicate that water ^{coming} directly from the gasoline plant is not a potential source of contamination but that the lake in which it accumulates is high in chlorides. It is possible that oilfield brines are also introduced into this lake. Disposal of such brines by other means may cause the lake to become gradually lower in chlorides.

5. No accumulation of refuse was found that could be considered as a source of permanent contamination to the fresh water sands.

6. It was found that numerous sources of possible contamination exist in the form of pipeline drips, tank battery burn pits, and salt water disposal pits. The latter source is expected to be eliminated in the near future after installation of proposed salt water disposal systems. Holding or disposing of oil in earthen pits is considered a possible source of contamination to the fresh water sands. This possible source of contamination can be controlled by NMOCC under existing rules and regulations.

The purpose

VI Possible Need for Rules and Regulation Governing the Drilling, Completion, and Abandonment of Water Wells in the Hobbs Pool Area.

1. There are no rules or regulations governing the drilling, completion, and abandonment of water wells in the Hobbs Pool Area.

2. There is a definite need for rules and regulations governing ~~domestic~~ water wells to (a) prevent further contamination of water in the Ogallala formation, and to (b) minimize the risks of producing contaminants that are now in the aquifer.

3. Rules and regulations should, in part, govern the location, depth, casing and cementing programs, surface and subsurface completion procedure, inspection, and abandonment of ~~domestic~~ water wells.

4. There is ^{also a} ~~a~~ definite need for rules and regulations governing the drilling and abandonment of geophysical "shot holes", core tests, or any other boring or excavation that penetrates ~~the~~ Ogallala ~~formation~~.

fresh water sands.

VIII The Possibility of, and Methods for, Obtaining Potable Water from the Areas of Apparent Contamination.

The Committee finds as follows:

1. It should be possible to obtain potable water at almost any location in the Hobbs Pool Area provided that proper depth is penetrated, proper methods used to complete the water well, and reasonable caution is used in locating the well with respect to nearby possible sources of contamination.

2. Since most contamination by oil and gas is evidenced in shallow wells, and since oil and gas will tend to migrate upward toward the water table, it would be advisable to complete water wells as deep as possible in the Ogallala, cement casing to the completion depth, seal around the top of the casing at the surface, and have the casing extend above the natural ground level.

3. Since some evidence indicates that various depths may be contaminated, casing should be cemented so that shallower intervals can be tested if contamination is found in deeper intervals.

4. If a water well in the Hobbs Pool Area evidences contamination by oil and/or gas, this water can be made potable by removing the oil at the surface by a simple skimming or settling process. Gas can be removed by aeration. If gas contamination is severe, it might be necessary to use several cascade type trays with a layer of activated charcoal in the bottom of each. This charcoal should not require frequent replacement. If a disagreeable odor or taste of hydrogen sulfide remains, a few PPM of chlorine added to the water should remove the odor and taste. Water produced into and held in pressure tanks will retain gas in solution to be released when water is drawn ~~for household use.~~

with } from a faucet.

IX. Causes of oil and Gas Well Casing Deterioration And Methods of Determining The Existence of Defective Casing.

The Committee finds as follows:

There are numerous causes for deterioration of casing in oil and gas wells. Some of these causes are listed as follows:

1. Corrosive conditions are known to exist in the Hobbs Pool which can cause leaks in any casing string subjected to these conditions.
2. Severe internal casing corrosion can result from the presence of hydrogen sulfide contained in gas produced with the Hobbs crude oil.
3. External or internal casing corrosion can result from electrolytic action, sulfate reducing bacteria, or galvanic action.
4. Stress concentrations resulting from even mild corrosion can cause failures of the well casing.
5. Wear between the tubing and casing in pumping wells is caused by the movement of tubing during the pumping cycle and can cause casing leaks.
6. Pressure in formations behind the casing can cause collapse of the casing.
7. Casing will be subjected to continued high pressure from the producing formation throughout the foreseeable future. Hobbs Pool bottom hole pressures averaged 941 psig in 1956 and 986 psig in 1954, indicating very gradual decline.

8. NMOCC records indicate that to this date defective casing has been repaired at 63 Hobbs Pool wells.

9. With continued high pressure on the casing and considering the age of the remaining Hobbs Pool wells where casing has not been repaired, the instance of casing leaks can be expected to increase during the 20-30 years remaining life of the pool.

X Methods of Detection (see above)

There are numerous methods available by which defective casing can be detected. Some are listed as follows:

1. Internal caliper surveys to gauge the extent, depth and location of corrosive attack on the internal string of casing.
2. Temperature surveys to locate temperature anomalies as possible casing leaks. *indications of*
3. Hydraulic pressure tests using packers to determine if a leak exists and to locate the leak.
4. Potential profile surveys to determine the probability of external casing corrosion and thereby the likelihood of casing leaks.
5. Bradenhead pressure surveys to determine by pressure observations on the several casing strings the possible existence of casing leaks

6. Chemical analysis of produced water as an indication of a casing leak through the presence of foreign water.

7. Lack of normal clearance between tubing and casing as an indication of possible casing collapse or of parted casing.

8. Any observed abnormal performance of the well with respect to bottom hole pressure, gas-oil ratio, water production, or oil production.

9. Unusual performance or presence of foreign liquid or gas in shallower oil, gas, or water wells in the vicinity.

10. Electrical logs, permeability surveys, and radioactive tracer surveys to locate leaks or parted casing.

The method or combination of methods best adapted for any particular well will depend upon the conditions which exist at each individual well. The bradenhead pressure survey is least expensive, quicker, and very effective under proper conditions.

II
Programming of Bradenhead Pressure Tests on Oil and Gas Wells in the Hobbs Pool Area.

The Committee finds as follows:

1. Bradenhead pressure surveys, ^{should} where the several casing strings are open for pressure measurement, ~~will~~ indicate whether or not a casing leak exists and therefore the possibility of fresh water sand contamination at the well being tested.

2. Bradenhead pressure surveys conducted annually are too infrequent to provide adequate warning of possible contamination of the fresh water sand.

3. Bradenhead pressure surveys conducted quarterly should provide more! adequate warning of possible contamination of the fresh water sand.

^{It should be necessary for}

4. The NMOCC ~~has~~ ~~not~~ ~~been~~ ~~permitted~~ to witness only one of the quarterly bradenhead pressure surveys.

5. The operators of the individual wells ^{should} ~~can~~ conduct the other three surveys, recording and saving the test results, and filing a certification with NMOCC that all wells operated by that operator have been tested and ~~that~~ ~~no~~ ~~indication~~ ~~of~~ ~~a~~ ~~leak~~ ~~has~~ ~~been~~ ~~found~~. ^{whether or not leaks have been found.}

6. All producing oil and gas wells, ~~including~~ abandoned wells, temporarily abandoned wells, and salt water disposal wells, should be scheduled for the quarterly bradenhead surveys.

7. There are a number of old oil wells in the Hobbs Pool area with the intermediate casing set on open surface casing with clamps, thereby preventing pressure observation.

8. Such open surface casing is a possible source of fresh water sand contamination since the top of the surface casing is in the bottom of cellars.

9. In order to obtain valuable information during bradenhead pressure surveys and to eliminate one possible source of contamination, the top of the annular space between the clamped intermediate casing and the surface casing should be sealed and vented to the surface.

Methods of Repairing Oil Well Casing Found To Be Defective And
The Prevention of Casing Deterioration.

The Committee finds as follows:

There are numerous means by which casing can be effectively repaired. The method to be used will depend upon the conditions which exist at the individual well. Some of these methods, ~~listed in the general order of preference with respect to protection of the fresh water sands,~~ are as follows:

1. Recover the entire casing string found to be defective and run and cement an entirely new casing string.
2. Run and cement a full string of smaller casing inside the defective casing.
3. Recover that portion of the casing string found to be defective, replace defective casing, and re-run casing string using casing bowl overshot or other method to tie back on to and seal with casing left in the hole.
4. Run and cement a liner covering that portion of the casing found to be defective.
5. Circulating cement to the surface between casing strings during completion or repair operations.
6. Squeezing cement through casing leaks and obtaining a solid final build up squeeze pressure. ~~Leaks repaired by this method should be protected by setting a packer below the leak (s) and filling the annular space above the packer with non-corrosive liquid.~~

IX-A

There are numerous means and materials available to the oil industry by which oil and gas well casing deterioration can be minimized or eliminated. Some of these means and materials are listed as follows:

1. Coatings applied to the interior and/or exterior of casing.
2. Numerous and various chemicals injected into oil and gas wells to minimize corrosive attack.
3. Induced electrical current or elimination of electrical current to minimize electrolytic corrosive attack.
4. Spotting chemically treated mud outside of casing to prevent corrosive attack by sulfate reducing bacteria.
5. Setting packers in the casing in or above the producing formation and filling the annular space above the packer with non-corrosive liquid.
6. Circulating cement between strings of casing.
7. Using anchors or guides to prevent tubing on casing wear.

VII. Establishment of a water well observation program to detect any new contamination and to observe the movement, if any, of contamination from the area northwest of Hobbs.

1. At least 42 wells, and probably more, are available for observation purposes in the Hobbs Pool area. The attached tabulation lists these wells according to their location and accessibility to water level measurements and to water sample collection.
2. As much information as possible should be collected regarding the potential observation wells. Such information should ideally include the driller's log, date drilled, depth, casing program, location of any perforations, accurate location of the well with reference to the land net and to relatively permanent landmarks, and an accurate description of the measuring point.
3. It is believed that an effective network of observation wells can be established by evaluating the potential observation wells with regard to their location within the Hobbs Pool area and to information available regarding their completion. ✓

Please find attached a list of casing leaks and leak repairs in the Hobbs Area and related pools as of July, 1957.

This tabulation was prepared by the Hobbs Water Contamination Committee of which Tidewater is a member.

The heading of this table is somewhat misleading in that it represents communication between casing string which could either be leaks or bad cement jobs.

H. P. Shackelford

Committee Meeting
Water Contamination

Mr. R. H. Coe - Tulsa

Production Hobbs

Mr. H. G. Wesberry - Midland
Mr. Jack Jones - Tulsa

August 8, 1957

Fourth meeting of "Committee to Study Protection of Hobbs Fresh Water Sands" met Thursday, August 8, 1957 at 9 A.M. in the New Mexico Oil Conservation Commission's conference room. Mr. J. W. Brown, PanAmerican Petroleum Corporation, presided. Representatives from Continental Oil Company, Samedan Oil Company, Shell Oil Company, Tidewater Oil Company, New Mexico Oil Conservation Commission and State Engineer's office were present.

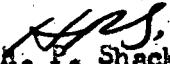

The Committee appointed to check all water wells reported their findings to date. 374 water wells were found in the Hobbs area. 27 of the water wells were contaminated. 9 of the wells were contaminated with oil, 1 with oil and gas, 16 with gas and 1 with sewage. 32 were found that had been abandoned, but not plugged.

Ohio Oil Company drilled a water well in the early days of the field and the water was gassy. At that time the only oil wells in the Hobbs Pool were at least one mile east of the water well.

Continental Oil Company's State A-29 Well No. 6, Unit N, found oil in the salt section. On September 10, 1946 applied for permission to run the distress oil.

Four committees were appointed to work on the findings of the "Committee to Study Protection of Hobbs Fresh Water Sands". Final report of committee should be in with in five weeks.

Next meeting called for 9 A.M., August 22, 1957.

H. P. Shackelford

FOURTH MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
AUGUST 8, 1957

The fourth meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OCC Conference Room in Hobbs, New Mexico, on August 8, 1957. Official representatives present and taking part in the meeting were as follows:

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
R. J. Francis, Alternate	Continental Oil Company
R. F. Montgomery, Member	New Mexico Oil Conservation Commission
G. W. Putman, Member	Samedan Oil Corporation
J. W. Montgomery, Alternate	Shell Oil Company
R. L. Borton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company

Others present:

Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Runyan	New Mexico Oil Conservation Commission

The meeting was called to order at 9:15 a.m. by J. W. Brown, Acting Chairman.

Reports were heard from the two sub-committees which had not completed their assignments.

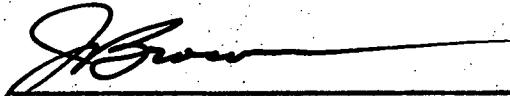

Final discussion was held on several items which had not been completed at previous meetings.

Considerable discussion was devoted to the preparation of the Committee's final report. Assignments were made to the various

organizations and companies to commence drafting the final report.

The next meeting was scheduled to be held at 9:00 a.m. in the OCC Conference Room in Hobbs on August 22.

The meeting was adjourned at 11:30 a.m.

J. W. Brown
Acting Chairman

COMMITTEE MEETING - AUGUST 8, 1957

Jack Brown - Presiding - Pan Am

Water well Committee: R. Montgomery

374 water wells found

Contaminated 27 - (9 oil - 16 gas)

1 sewage - 1-620)

Found 32 wells - Not used that
are still open.

64 wells - done some remedial
work in Hobbs Pool Area.

Dated from: 1946

This of water well
contaminated when drilled and
only oil wells were 1 mile or more
out.

Observation wells look for:

1. Water Table

2. Sample of Fluid, ^{a. Check for Gas & Oil.}
~~(Quantitative)~~
Hydrocarbon (C₁)

3. Sample all contaminated wells, except 6 known
which have been checked. Check wells immediately
surrounding area of contamination. Total
of about 45 wells.

As check open wells if time
Permits.

check & get observation after
the Sunday

Committee to check other means
of Pollution.
We have sent samples off
for analysis.

About 4 Byers box wells
in Robber Area.

Phillips has some earlier
data where the plow box lines
Some times they have 100 plus
barrels on the pit.

Every day - was oil produced
in earlier pit?

Continental State A-29 - #6
Unit N - 29-48-23
Oil or Salt Section while
drilling

Sept. 10, 1956 permission
to run distillate oil.

Group of 2 - would make
4 groups.

MEMORANDUM

TO: A. L. Porter, Jr., Director, Oil Conservation Commission

FROM: Committee Studying Fresh Water Contamination
in the Hobbs Pool Area.

SUBJECT: Progress Report.

This Committee was appointed and its assignment made at the general meeting called by the Oil Conservation Commission on July 9, 1957. At that time a progress report was requested within 30 days. This is that progress report.

The Committee met for the first time in Hobbs, New Mexico, on July 19, 1957, and subsequently on July 25, 1957, and August 1, 1957. All of the organizations and companies appointed to the Committee had representatives present at each meeting.

It is the consensus of the Committee that their assignment as a whole is approximately 50% completed and that their work will be completed with a final report prepared by the first week of September, 1957.

The principal items discussed during the three committee meetings were as follows:

1. The physical characteristics of the Ogallala formation and the movement of water through this aquifer. Introduction on the subject was furnished by Messrs. E. G. Minton and Zane Spiegel.
2. The exhibits prepared by Mr. J. W. Runyan and presented at the general meeting held on July 9, 1957.
3. Apparent contaminated conditions which exist in the Ogallala formation northwest of the City of Hobbs.

Progress Report Cont'd

4. Feasibility of eliminating or removing the apparent contamination.
5. The possibility of contamination of the Hobbs City water supply by migration from the area of apparent contamination.
6. Possible contamination of the fresh water by sources other than oil or gas wells such as sewage, waste oil and acid, open storm sewer ditches, gas plant waste water, refuse, and oil held in earthen pits.
7. Possible need for rules and regulations governing the drilling, completion and abandonment of water wells in the Hobbs pool area.
8. Establishment of an observation water well program to detect any new contamination and observe the movement, if any, from the area to the northwest of the City of Hobbs.
9. Possibility of, and methods for, obtaining potable water from the areas of apparent contamination.
10. Methods of determining the existence of defective casing in oil and gas wells.
11. Programing of bradenhead pressure tests on oil and gas wells in the Hobbs Pool area.
12. Method of repairing oil well casing found to be defective.

During the course of the above discussion, the need for subcommittees was indicated and three were appointed at the meeting on July 25.

1. Subcommittee to locate and gather data on all water wells in the Hobbs Pool area.

Oil Conservation Commission - Chairman
Continental Oil Company
State Engineer's Office
Shell Oil Company

This subcommittee made a progress report on August 1, indicating that their assignment was approximately 35% completed and expected to complete their assignment within three weeks.

Progress Report Cont'd

2. Subcommittee to study water well completion and abandonment practices in the Hobbs Pool area.

Tidewater Oil Company - Chairman
City Water Board
State Engineer's Office
Samedan Oil Corporation

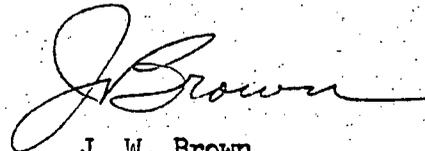

This subcommittee made a progress report on August 1, indicating that their assignment was completed.

3. Subcommittee to study possibilities of fresh water contamination through the disposal of waste products.

Samedan Oil Corporation - Chairman
Pan American Petroleum Corporation
City Water Board

This subcommittee made a progress report on August 1, indicating that their assignment was 75% completed and should complete their assignment within one week.

For the Committee

J. W. Brown
Acting Chairman

Committee Meeting
Water Contamination

Mr. R. H. Coe - Tulsa

Production Hobbs

Mr. H. G. Wesberry - Midland
Mr. Jack Jones - Tulsa

August 1, 1957

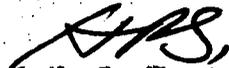

Third meeting of "Committee to Study Protection of Hobbs Fresh Water Sands" met Thursday, August 1, 1957 at 9:00 A.M. in the New Mexico Conservation Commission's conference room. Mr. J. W. Brown, Pan American Petroleum Corporation, presided. Representatives from Continental Oil Company, Samedan Oil Company, Shell Oil Company, Tidewater Oil Company, Hobbs City Water Board, New Mexico Oil Conservation Commission, and State Engineers Office were present.

There was a general discussion of work performed by the three sub committees appointed at last meeting. Two of the committees had not completed their work. Attached is a letter from "Committee to Study Completion of Fresh Water Wells".

The Oil Conservation Commission reported that a total of 67 casing leaks have been repaired in the Hobbs Pool. Nine of these leaks were prior to 1952 and some date back to 1946. There are 293 wells in the Hobbs Pool and 51 wells in the Bowers Pool for a total of 344 wells. This means that 20% of the wells in the Hobbs & Bowers Pools have been worked on for casing leaks.

The next meeting of this committee was called for 9:00 A.M., August 8, 1957.

I heard, from a confidential source, that a damage suit will soon be filed.

H. P. Shackelford

HPS:bb

Attachment

Hobbs, New Mexico
July 31, 1957

Mr. J. W. Brown, Chairman
Committee Studying Protection of Hobbs Fresh Water Sand
Box 899
Roswell, New Mexico

Dear Mr. Brown:

Committee appointed to study fresh water well completion in
the Hobbs Pool met in Tidewater Oil Company's office at 9:40 A.M., Wednes-
day, July 31, 1957.

Present at this meeting were:

W. G. Abbot - City Water Board
J. E. Wright - State Engineers Office
G. W. Putman - Samadan Oil Company
C. E. Layne - Samadan Oil Company
H. W. Miller - Tidewater Oil Company
H. P. Shackelford - Tidewater Oil Company

After a general discussion of water well completion, the
above members agreed upon, and wish to submit, the following recommendations
for completion of fresh water wells in the Hobbs Pool:

- A. Minimum requirements for completing a water well.
 - (1) Set casing 25' below top of water table.
 - (2) Use five sacks of cement around bottom
of casing.
 - (3) Construct well in such manner that no
surface contamination can occur.
- B. That State Engineers' Office supervise the drilling and
plugging of all fresh water wells.

Very truly yours,

HPS:bh

H. P. Shackelford, Chairman

cc: Mr. W. G. Abbot
Mr. J. E. Wright
Mr. G. W. Putman & C. E. Layne

THIRD MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
AUGUST 1, 1957

The third meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OCC Conference Room in Hobbs, New Mexico on August 1, 1957. Official representatives present and taking part in the meeting were as follows:

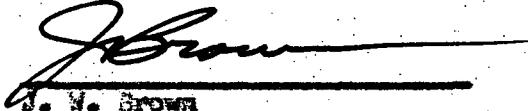

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
E. C. Lannen, Alternate	Continental Oil Company
R. J. Francis, Alternate	Continental Oil Company
W. G. Abbott, Alternate	Hobbs City Water Board
H. F. Montgomery, Member	New Mexico Oil Conservation Commission
E. J. Fischer, Alternate	New Mexico Oil Conservation Commission
G. W. Putman, Member	Sasadan Oil Corporation
R. E. Layhe, Alternate	Sasadan Oil Corporation
J. W. Montgomery, Alternate	Shell Oil Company
R. L. Borton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company
Others present:	
Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Runyan	New Mexico Oil Conservation Commission

The Meeting was called to order at 9:00 a.m. by J. W. Brown, Acting Chairman.

Reports were heard from the three sub-committees appointed at the meeting on July 25.

Preparation of the progress report and the final report were discussed. A sub-committee was designated to prepare the progress report.

The meeting was adjourned at 11:55 a.m.

J. W. Brown
Acting Chairman

MEETING - Aug. 1, 1957

3 P.M. MEETING

Discussion of Recommendation for
Completion of water well Completion.

Motion:

Accepted thanks and Report
Recommendation.

Water Well Committee

Found -

74 Water wells - Six
Contaminated -

Southern part through Friday
Northern part Monday.

(Friday T.O. - Conroy, R.P.M.C. - Hydrocarbon Contaminated)

Other Means of Contamination.

Holes - maintenance faulting
Leak of Fuel from service
Compressors to disposal of waste.
Recommend they are closed.

Gasoline plant - waste not bad.
Get analysis of plant water.

(Since 1931) (Two holes closed it was not
of plant & complete covered.)

Oil Wells. 2/1/57

Cemented each string to surface -
Cannot take a pressure.
Should run pressure test, ~~by pressure~~
by pressure, at string.

Total leases - that have
been repaired in the North Pod -
67. (9 leases to 1952 - some
go back to 1946).

Must draft program report by
August 9th.

~~Should~~
Should complete Report 6 weeks
from today.

Next Meeting 8-8-57 (Thursday)
9 A.M.

^{garden}
Phillips Corp - 6 wells -
3 contaminated.

Committee check ditch &
City Storm Sewer - SW of town.
Analysis of water sample.

Spent some time working on
ideas about final report -
Friday -

Hobbs, New Mexico
July 31, 1957

Mr. J. W. Brown, Chairman
Committee Studing Protection of Hobbs Fresh Water Sand
Box 899
Roswell, New Mexico

Dear Mr. Brown:

Committee appointed to study fresh water well completion in the Hobbs Pool met in Tidewater Oil Company's office at 9:00 A.M., Wednesday, July 31, 1957.

Present at this meeting were:

W. G. Abbot - City Water Board
J. I. Wright - State Engineers Office
G. W. Putman - Samedan Oil Company
C. E. Layhe - Samedan Oil Company
A. N. Miller - Tidewater Oil Company
H. P. Shackelford - Tidewater Oil Company

After a general discussion of water well completion, the above members agreed upon, and wish to submit, the following recommendations for completion of fresh water wells in the Hobbs Pool:

- A. Minimum requirements for completing a water well,
 - (1) Set casing 25' below top of water table.
 - (2) Use five sacks of cement around bottom of casing.
 - (3) Construct well in such manner that no surface contamination can occur.
- B. That State Engineers' Office supervise the drilling and plugging of all fresh water wells.

IN RE: OIL & GAS POLLUTION - HOBBS POOL.

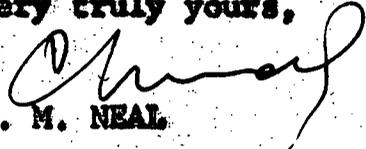

Dear Mr. Jones:

I instructed the photographer to make the pictures about which we were talking when you were out here in regard to the above matter, but as yet I have not been provided with the prints.

I have had no further indication that suit was to be instituted.

Mr. Perry, the local adjuster who handles the claims against Continental Casualty Company in this city, called me today and told me that he had been notified by the Denver office of the Continental Casualty Company, whom we sometimes represent, that there was a possibility Tidewater's insurance coverage afforded them protection in connection with the above matter. I do not know why they communicated this information to me as there is certainly nothing in my files to indicate a claim has been filed with Continental. If there is such a policy, it might be advisable to provide them with notice that the demand for damages has been made upon the company.

Very truly yours,

Second meeting of "Committee to Study Protection of Hobbs Fresh Water Sands," met Thursday, July 25, 1957 at 9:00 A.M. in the New Mexico Conservation Commission Conference Room. Mr. J. W. Brown, Pan American Petroleum Corporation, presided. Representatives from Continental Oil Company, Samedan Oil Company, Shell Oil Company, Tidewater Oil Company, Hobbs City Water Board, New Mexico Oil Conservation Commission, and State Engineers' Office were present. A representative of the New Mexico Oil & Gas Engineering Committee was also present.

There was a general discussion on how to remove the oil in the area of the Ellison water well from the water sand. No plan was advanced as to how it could be accomplished. It was the opinion of some present, that the oil was in a sand just above the water sand and had water wells been cased and cemented, when completed, there would have been no oil in the water sand. It seems that the 14 plug water wells drilled recently were drilled illegally, as no record, to date, has been filed with the State Engineers' Office.

It seems to be the opinion of members of the Committee that it would be a rather difficult problem to say which well caused the damage in the area of the McKinley lease.

Tests of oil wells for casing leaks was discussed. The committee felt that no well should have the annulus between surface casing and intermediate string open. Many wells drilled during the early days of the Hobbs Field did not use a bradenhead. The intermediate string was set on the surface string, using a clamp and leaving the annulus open. In deep cellars, and especially so on pumping wells, this is a probable source of contamination. It was decided to recommend Quarterly casing test, with the tests to be witnessed by MIOCC engineer, annually.

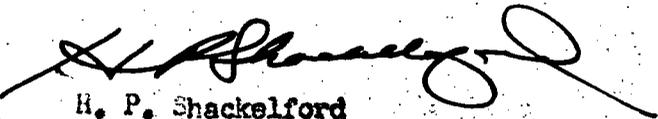

Three sub-committees were formed. They were: 1. Committee to Check All Water Wells in this Area and Plot them on a Map, with the idea of checking them regularly to see if oil, in water sand, is moving toward Hobbs. Members on this committee are: R. F. Montgomery, MIOCC - Chairman, Continental Oil Company, State Engineers Office, and Shell Oil Company; 2. Committee to Study Completion of Fresh Water Well and submit recommendation for completion and abandonment of future water wells. Members on this committee are: R. F. Shackelford, Tidewater Oil Company, - Chairman, City Water Board, Samedan Oil Company, and State Engineers Office.

COMMITTEE MEETING

- 2 -

3. Committee to Study other Means of Fresh Water Sand Contamination.
Members on this committee are: G. E. Loyhe, Samedan Oil Co., - Chairman,
Pan-American Petroleum Corporation, and City Water Board.

The committee on water well completion and abandonment will meet
Wednesday, July 31, 1957. The general committee will meet again on
Thursday, August 1, 1957.

H. P. Shackelford

SECOND MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
JULY 25, 1957

The second meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OCC Conference Room in Hobbs, New Mexico on July 25, 1957. Official representatives present and taking part in the meeting were as follows:

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
R. C. Lannen, Alternate	Continental Oil Company
R. J. Francis, Alternate	Continental Oil Company
W. G. Abbott, Alternate	Hobbs City Water Board
R. F. Montgomery, Member	New Mexico Oil Conservation Commission
E. J. Fischer, Alternate	New Mexico Oil Conservation Commission
R. E. Layhe, Alternate	Samedan Oil Corporation
R. C. Cabaniss, Alternate	Shell Oil Company
J. W. Montgomery, Alternate	Shell Oil Company
Zane Spiegel, Member	State Engineer's Office
R. L. Borton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company
R. N. Miller, Alternate	Tidewater Oil Company
Others present:	
Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Runyan	New Mexico Oil Conservation Commission

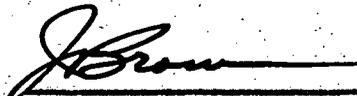

The Meeting was called to order at 9:00 a.m. by Mr. J. W. Brown, Acting Chairman.

The entire meeting was devoted to the discussion of elimination of contamination which may already exist and possible action to prevent future contamination. During the discussion three sub-committees were appointed.

1. Subcommittee to gather data on all existing water wells located in the horizontal limits of the Hobbs Pool.
2. Subcommittee to study drilling and completion practices for future water wells in the Hobbs Pool Area.
3. Subcommittee to study possibilities of contamination by disposal of waste materials in the Hobbs Pool Area.

It was agreed that the next meeting of the committee would be held in the Oil Conservation Commission Conference Room in Hobbs, at 9:00 a.m., August 1, 1957. In the meantime, subcommittees would meet.

The meeting was adjourned at 3:15 p.m.

J. W. Brown
Acting Chairman

COMMITTEE MEETING - 7-25-57 - 9 A.M.

NMOCC CONFERENCE ROOM

JACK BROWN - PAN AMERICAN - Presiding.

1. Practical way to Remove oil
From water Formation.

2. Humble well flowed 8000 +
the oil out Bordenland in
8-53. Found leaks in 9 3/8" in
8-47 @ 1200, 1500' & 2000'

Well one or 2 location
in a westerly direction was repaired
and Humble's wells started
decreasing rapidly.

(in Humble area)
Dec. 30 - 10 leaks repaired
(Some not leaks - Just Safety men)

Practically stopped by Sept 8, 1953,
(Started Repair on #1 in Humble, Sept. 8, 1953)

Do not believe Humble's well
Responsible - Maybe.

Bill Abbott - ~~Bill~~

Shwed probably Mr. Kirby's
according to time. Could have
been the well. (Pod) (we don't agree)

~~Bill~~

Maybe water Sander not a
well correct, in this area,
as thought (State Water Engineer)

~~Bill~~

Abbott - Suggested operator
board to get it. No further comment.

Port American found
no similar case in their
records.

~~Bill~~

Elimination of contamination
in existing water wells.

Ellison found oil in water
well this Spring (1957).

Go in Ellison wells - Case
and perhaps need to see if oil
can be eliminated.

Spegle - New Mexico Water Bond
Does not believe present unlined
wells - ^{New} not open - do not
present a hazard to future
drilled, ~~or~~ lined and cemented
water wells - His opinion.

R. Montgomery - ^{water} wells drilled
found ~~some~~ oil in sand
above water.

Doubt if water well could
be saved.

40-45' Sand rock.

Summary. - Brown.

1. Don't know area of contamination
(Rules out the drilling of W. wells)
2. List of water wells between
place of contamination and Hobbs,
(A good suggestion).

~~Submitted~~ Sub-Committee
form to get data on all water
wells in the Hobbs area
analysis and prepare map
showing same. Motion
carried.

R. Montgomery - Chairman.

1. Continued.
2. State Engineer.
3. Shell.

No permit to drill water wells on file. All wells drilled illegally by Ellison.

Water well completion.
1. Should be a rule to follow in completing water wells

Committee Meeting

Mr. W. J. Haugh - Tulsa

Production Hobbs

Mr. H. G. Wesberry - Midland
Mr. Jack Jones

July 22, 1957

First meeting of "Committee to Study Protection of Hobbs Fresh Water Sands," met Friday, July 19, 1957 at 1:30 P.M. in the New Mexico Conservation Commission Conference Room. Mr. J. W. Brown, Pan American Petroleum Corporation, presided.

Representatives from the following companies, in addition to Pan American, were present: Continental Oil Company, Samedon Oil Company, Shell Oil Company, and Tidewater Oil Company. Also, represented were: Hobbs City Water Board, New Mexico Oil Conservation Commission, State Engineer's office, and New Mexico Oil and Gas Engineering Committee.

Mr. E. G. Minton, with Lea County Water Re-charge Committee, gave a short talk on Ground Water Movement. He stated that general movement of Ground Water in this area was from northwest to southeast and the rate of travel was 7 to 9 inches per day. Several questions were asked about regulations governing the drilling, completion and plugging of water wells. There are no regulations in this area governing any of these operations. His definition of a water well driller, I thought, was different from any I had ever heard. He said, "Anyone with \$20 and could sign his name could qualify as a water well drilling contractor."

It was voted that the meetings should be closed to outsiders. It seems to be the opinion of all present that Hobbs City Water supply was not in danger, that the contamination was a local condition and that it would be hard to say who was at fault.

The chairman told me, after the meeting, that he understood we were having a little trouble with the surface owners in this area, and if any talk at these meetings seemed to indicate that we were at fault, just to give him a sign and he would stop it immediately, because the purpose of the Committee was not to try to fix the blame on anyone. I appreciated this.

The next meeting will be at 9 A.M., July 25, 1957.

H. P. Shackelford

MEETING OF
COMMITTEE STUDYING PROTECTION OF
HOBBS FRESH WATER SANDS
HOBBS, NEW MEXICO
JULY 19, 1957

A meeting of the Committee Studying Protection of Hobbs Fresh Water Sands was held in the OCC Conference Room in Hobbs, New Mexico on July 19, 1957. Official representatives present and taking part in the meeting were as follows:

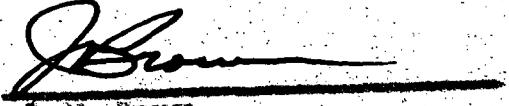

J. W. Brown, Acting Chairman	Pan American Petroleum Corporation
R. C. Larman, Alternate	Continental Oil Company
E. V. Boynton, Alternate	Continental Oil Company
L. A. Calhoun, Member	Hobbs City Water Board
W. G. Abbott, Alternate	Hobbs City Water Board
R. F. Montgomery, Member	New Mexico Oil Conservation Commission
E. J. Fischer, Alternate	New Mexico Oil Conservation Commission
G. E. Layne, Alternate	Samedan Oil Corporation
W. E. Owen, Member	Shell Oil Company
R. C. Cabaniss, Alternate	Shell Oil Company
Zane Spiegel, Member	State Engineer's Office
L. L. Barton, Alternate	State Engineer's Office
H. P. Shackelford, Member	Tidewater Oil Company
R. H. Miller, Alternate	Tidewater Oil Company
Others present:	
Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Boynton	New Mexico Oil Conservation Commission
G. Kirschfeld	New Mexico Oil and Gas Engineering Committee

The Meeting was called to order at 1:30 p.m. by Mr. J. W. Brown, Acting Chairman.

Mr. E. G. Minton from Lovington, New Mexico, was guest speaker and spoke on the movement of water in the fresh water sands. Afterwards, the Committee discussed possible means to prevent spread of contamination in the fresh water sands and eliminate the contamination which may have already occurred. No conclusion was reached.

It was agreed that the next meeting of the Committee would be held in the GCS Conference Room in Hobbs, at 9 a.m. July 25, 1957.

The meeting was adjourned at 4:10 p.m.

J. W. Brown
Acting Chairman

JULY 19, 1957 - 1:30 P.M.

July 17, 1957

MR. CHARLES R. BROWN
TULSA

Re: Getty Oil Company McKinley Lease,
Lea County, New Mexico

The New Mexico Oil Conservation Commission held a hearing at Hobbs, New Mexico, on July 9, 1957 to hear evidence of pollution of the water supply for the City of Hobbs. This hearing was called at the request of city officials. Tidewater was represented by the undersigned and Messrs. Shackelford and Miller from the Hobbs Production Office and Mr. Wesberry from the Midland Office. Mr. Melvin Neal, Attorney, also attended at our request. Mr. Cavanaugh attended the meeting on behalf of Getty Oil Company.

A. L. Porter, Jr., State Geologist and Secretary of the Conservation Commission, presided over the meeting. As soon as the meeting opened, Mr. Porter announced that a tour of the area had been planned to point out instances of pollution and possible causes of the pollution. Under the direction of the Commission staff all parties at the hearing then proceeded to the Hobbs field, making predetermined stops for demonstrations and comments by staff members. The first stop was the site of Dowell's Hobbs Office within the City of Hobbs. Dowell drilled a water well at this site several years ago to a depth of 120'. A lighted match was placed above the nozzle of a hose connected to this well and spurts of flame indicated the presence of gas in the water.

The next stop was on the McKinley Lease. We were taken to the back yard of Mr. W. H. Ellison, surface owner of part of the lease, and shown a jar of crude which had been taken from his water well. Test measurements indicated that the well had 6.3' of free oil above the water level. This was the major stop on the tour. The staff explained in detail the appearances of oil in water wells on this lease. As you have previously been advised, all of these wells are drilled to the shallow water sand. It was interesting to note that the free oil column in the water wells diminished as the wells approached the McKinley No. 6. Wells drilled immediately adjacent to the No. 6 have less than one foot of oil.

The group was next taken through the central part of the field, where large open oil pits and waste water pits were pointed out.

When the hearing reconvened after the tour, a staff member gave the group a report on the background of the hearing. Mr. J. O. Walton, an attorney in Hobbs, had appeared before the City Commission and stated that the city water supply might be in danger of pollution from oil wells. (On that same date Mr. Walton wrote Tidewater demanding damages for Messrs. Ellison and Goins.) The Commission then called this meeting to discuss the problem.

The Commission had known of fresh water pollution for several years. Since 1954 they have conducted casing leak surveys. Some 45 casing leaks were discovered and all have been repaired at a cost of approximately \$400,000 to the operators. There are no casing leaks in the field at this time. The Commission then asked for comments on methods to protect the water supply.

Lloyd Calhoun, Member of the City Water Board and President of the Chamber of Commerce, announced that the Water Board had investigated the problem and that there is no threat to the city water system. He asked the City to withdraw its request for hearing and condemned the newspaper publicity. The City Attorney said the City was interested in a solution to the problem of the oil that is now in the water formation, and that they wanted the hearing to continue in order to seek the solution.

Various operators pledged their support to the Commission in its efforts to avoid pollution. The presiding official, Mr. Porter, then stated that he was also of the opinion that there is no contamination of the city water supply and that he had attempted to explain that to the newspapers. He then appointed a committee to study the problem and recommend any action required to prevent further pollution. The committee is composed as follows:

Pan American - Chairman	City Water Board
Tidewater	State Engineer's Office
Shell	Commission Staff
Standard	
Continental	

We reach the following conclusions as a result of this hearing:

1) The water bearing sands underlying the surface of the Hobbs pool are in three lenses, which may or may not be in communication. The shallowest sand has been contaminated for years. The City is taking its water from the deepest sand, which shows no evidence of

Mr. Charles R. Brown - Page 3

oil contamination. We are in no danger of being sued by the City at this time.

2) Pollution of the shallow water formation first occurred in about 1935. Most of the operators in the field contributed to the pollution. In any lawsuit for damages the defendant could join all operators in the field as co-defendants and require contribution of damages from most of them. The statute of limitations might prevent any recovery by a plaintiff.

3) Tidewater and Getty will probably be sued by Ellison and Goins. Their attorney brought up the matter of possible pollution of the city water supply to create public sentiment in favor of his clients and against oil producers. We have several possible defenses to such a lawsuit, and have a fair chance of winning the case.

Re: OIL AND GAS POLLUTION OF WATER
SANDS UNDERLYING HOBBS FIELD,
LEA COUNTY, NEW MEXICO

The Hobbs Field embraces an area of approximately eight miles northwesterly and southeasterly by approximately four miles at the widest part. Approximately half of the field is located within the city limits of Hobbs. There are 293 San Andres wells in the Field producing from the approximate depth of 4200 feet, six of which are Tidewater wells and four of which are Getty Oil Company wells. There are also 51 Ewers sand wells producing from the approximate depth of 3200 feet, of which two are Tidewater wells and three are Getty wells.

30-160

The Oogaloga water sand at approximately 100 feet underlies all of the Hobbs Pool and a considerable area in addition. Wells drilled to this sand are the source of water for the City of Hobbs. Tidewater has an Oogaloga sand water well on its Grimes Lease and also on its Hardin Lease, both of which produce uncontaminated potable water. Four or five water wells have been drilled in the past on Getty's McKinley Lease. We do not have the depth of these wells, but assume that they were drilled to the approximate depth of 30 to 50 feet. Mr. Shackelford will check these wells. - *No Read volume*

Mr. Shackelford will also further check the Dowell water well approximately a mile and a half east of the McKinley tract and advise the depth of the completion and any local condition that might explain contamination in that well.

We were advised by Mr. Dunlavy of Skelly that contamination in the 30/50 foot water sand has existed in this Field for the past 15 years. Mr. Shackelford will further check evidence of early contamination, particularly in proximity to the McKinley Lease.

The wells drilled on the tracts on subdivisions of the McKinley Lease have been drilled to the 30/50 foot sand and completed and produced from open holes with probably not more than eight

Mr. Charles R. Brown - #2

to ten feet of surface casing. The approximate cost of drilling such a well in this manner would be \$50 to \$75. The cost of drilling a 100 foot Ogallala sand water well, including the casing and equipment, would be approximately \$1750.

Getty's McKinley Lease, which is more than a half mile from the nearest city water connection, has been subdivided by the surface owners, two of whom (Ellison and Coins) have employed Joseph A. Walton (now associated with W. D. Girard), who has made claims on behalf Coins for damages in the amount of \$45,000 and Ellison in the amount of \$25,000, based on contamination of water wells on their respective properties. Walton has stated in each demand that his client has drilled some fourteen wells and has concluded that all of the water underlying his land is contaminated. We are not replying to these demands, and anticipate that suit will be filed shortly in both cases. We also anticipate that further suits may be filed on behalf of other purchasers in this subdivision.

No claims have been made against Tidewater for water contamination on any Tidewater lease.

Walton appeared at a meeting of the Hobbs City Commissioners on June 17 on a petition to apply to the Oil Conservation Commission for a hearing on contamination of water sands threatening the Hobbs water supply. The evidence that Walton presented at this hearing was stated to be samples taken from water wells drilled on the McKinley Lease. We assume, and Mr. Shackelford is making a further investigation to verify, that all wells drilled by Walton's clients on the McKinley Lease were to the 30/50 foot sand and that no wells have been completed on the McKinley Lease to the Ogallala sand. It would therefore appear that the evidence that Walton presented of contamination of the 30/50 foot depth would not indicate contamination of the Ogallala sand, the source of Hobbs' water supply, there being no communication between these sands. Nevertheless, at the request of the City Commission, the New Mexico Oil Conservation Commission has set a hearing on July 9 at 10 A. M. at the Office of the Oil Conservation Commission at Hobbs for the purpose of determining the most feasible method of protecting the fresh water from contamination, at which each operator in the Hobbs Pool is asked to have at least one representative present who is authorized to speak on the policy of the company. Mr. Jack Jones will attend from this office, representing Tidewater as operator. Mr. Melvin Neal, local counsel at Hobbs, will appear for Getty

all wells are Ogallala

do not know

Mr. Charles R. Brown - #3

Oil Company. I have advised Mr. Cavanaugh of this meeting and he has indicated that he will attend for Getty Oil Company.

Reference is made to Mr. Shaskelford's report of June 12, 1957 summarizing the casing leak surveys made by the New Mexico Oil Conservation Commission on the McKinley Lease and remedial work which has been done on that lease. Mr. Shaskelford advises that all tests which indicated pressure build-up between casing in the McKinley wells showed it to be between intermediate strings, and have in no case indicated a casing leak in the formation casing which could cause contamination of water sands in these wells. Therefore, the records of the New Mexico Conservation Commission showing the results of these pressure tests and our remedial work on these wells should not be evidence of casing leaks which would cause the contamination complained of in the 30/50 foot water sand on the McKinley Lease. We can expect, however, that these claimants will attempt to use these surveys and our remedial work as evidence of casing leaks causing contamination. Other than these pressure surveys and our remedial work, and except for the fact that we are producing oil and gas on this lease, there is no evidence that we know of to indicate the McKinley wells are a source of the 30/50 foot sand water contamination.

Summarizing, we are of the opinion that the claims for water contamination on the McKinley Lease may be defended on the following grounds:

- 1) That Getty Oil Company has at all times exercised due care in the drilling, completion and operation of its wells on the McKinley Lease to prevent water contamination, and that Getty Oil Company at no time has violated any rule or regulation of the New Mexico Oil Conservation Commission with respect to protection of fresh waters.
- 2) That the contamination of the 30 foot water sand has existed for many years and the fact of this contamination was common knowledge in the area. In order to sustain a defense under New Mexico's four year statute of limitation we will have to establish either that the landowner knew of the contamination of this sand or by the exercise of diligence should have known.

Skelly was contacted, we believe, by previous landowner.

- 3) The evidence of prior contamination can also be used to establish that the contamination existed prior to the time these claimants acquired title, and unless there is evidence of a continuing contamination the present claimants would be unable to recover for the contamination that existed at the time they purchased the property, in the absence of an assignment of the prior owner's right of action.
- 4) Open hole completions of claimants' wells is not a reasonable method of completion in an oil field of this character, and the highest degree of diligence by the oil and gas lessee could not prevent contamination of water wells completed in this manner. ?
- 5) Even if it be found that the lessee is charged with the duty of preventing contamination of the 30 foot water sand, the surface owner would be required to minimize his damage by drilling a water well to the 100 foot sand where, the evidence will establish, there is uncontaminated water source. Therefore, the measure of damage in any case would not exceed the difference between the cost of completion of a 30 foot sand well and the completion of a 100 foot sand well, which in no case would exceed \$1700. I do not mean to suggest that we should attempt to use this as a basis of settlement, inasmuch as it might be a very expensive matter to pay \$1700 to the surface owner of each subdivision of the McKinley Lease.

At the July 9 hearing it is my recommendation that neither Tidewater nor Getty Oil Company make any statement unless called upon to do so by the examiner for the Oil Conservation Commission. If either company is called upon to make a statement, I would make a statement in general terms to the following effect: that Getty Oil Company and Tidewater have at all times operated their properties to protect fresh water sands underlying these properties, and that they have at all times taken such remedial measures necessary to prevent contamination. If either company is specifically questioned on casing leak surveys, we can state that all casing leaks indicated on these surveys have been between intermediate strings and cannot be considered as a source of contamination of fresh water sands and, further, that we will at all times cooperate with the Oil Conservation Commission, the City of Hobbs, and all surface owners in the protection of fresh water sources.

Mr. Charles R. Brown - #5

Inasmuch as Tidewater and Getty have only 15 wells out of a total of 344 wells in this Field, we should not take the lead in this hearing. We can expect, however, that Walton will appear for the purpose of questioning our representative, and for this reason I would think that it might be advisable to make any statement through our local counsel, Melvin Neal. Mr. Jones and Mr. Neal will confer with Mr. Cavanaugh and follow his decision with respect to any statement by Getty Oil Company.

Fresh Water - Hobbs Area

Mr. H. D. Page - Tulsa

Production Hobbs

Mr. W. J. Haugh - Tulsa

June 28, 1957

As requested in your telephone conversation of June 27th, we have obtained additional data on the fresh water in the vicinity of Hobbs. We are also attaching a copy of the map submitted with our report dated June 12th.

The strata producing water is found in the Ogolaga formation which vertically extends from the base of the caliche to the top of the Red Beds. In the vicinity of Hobbs, this water sand is composed of 3 lenses found at a depth of 30-50', 70-100', and 135-160'. In other areas in Lea County fresh water is found as low as 100'. At the present time the NMOCC is trying to determine if an impervious barrier exists between the lenses. Preliminary work to date indicates no existing one. A map is attached showing the limits of Ogolaga water in the Lea County Water Basin.

In Table I you will find the formation records of Tidewater's water wells on the Grimes and Hardin leases. Both of these wells are producing good quality water and are completed in the 135'-160' strata.

A few years ago, Dowell, Inc. moved their yard, north of Hobbs on the Lovington Highway. They drilled a water well to supply water needed for their operations. This water well is located in NW/4 NE/4 of Section 28, T18S, R38E, Lea County, New Mexico, approximately 1-3/4 miles east from the Getty McKinley lease. The well was drilled to a total depth of approximately 120'. Pipe was set through with cement and perforated. This is a good high volume water well, however, it makes some gas. An oil well, just north of Dowell's well, was worked on shortly after completion of the water well and the gas contamination was decreased considerable. A work-over rig recently moved in to work over the west offset to the above mentioned oil well.

Table II shows the location and total depth of all water wells that have been used by the city of Hobbs. In all cases wells which have been abandoned were done so because of insufficient water volumes. Location of these wells are shown on the attached Hobbs City Map. None of the wells produce above 100' and all produce good quality water. Well #13 near the Dowell has been watched very closely for two years for signs of water contamination, but none has appeared as yet. For the last two months this well has been used for emergency pumping only.

Mr. Dunlavy, Supt. for Skelly Oil, stated that water in the area of Getty's McKinley has been contaminated for 10-12 years, but no definite proof can be found.

Well records on the Grimes, State "B" and Hardin leases have been reviewed and we find that 3 casing repair jobs have been performed, however, one of these wells has since been abandoned. These wells and description of work performed is listed below:

Grimes #2:

11-1-46 Found holes in 7" @ 1530 to 2960'. Ran 5-1/2" and set @ 3350' w/ 100 sks. Perforated 3270-72' and squeezed w/ 50 sks.. Perforated 3086-88 and squeezed with 100 sks. Perforated 3148-3255' in Bowers sand for production.
7-6-51 Well abandoned.

Grimes #3:

1-1-46 Ran Baker Packer and found holes in 7" casing at 368-373 & 398-403. Squeezed with 120 sks. cement. Drilled out cement. Tested casing w/ 1000# before and after drilling plug. Held okay.

Boone Hardin #3

1-12-43 Perforated 7" casing @ 2710 and cemented with 450 sks. Cement circulated between 7" & 9-5/8" csg. Tested with 1200# before and after drilling plug. Held okay.

In the later part of 1956, a casing leak survey was conducted by the OCC on the three leases and no casing leaks were found.

The data on Hobbs City water wells was obtained from a member of the City Water Board and we were informed that the Water Board was not consulted before action was taken by the City Commission. Some people believe the action to be a "head-line seeking" adventure. This member of the Water Board informed us that for over two years, they had been aware of the problem and had met with the State Water Engineer to discuss financing of water wells away from the city, if and when the present Hobbs supply was contaminated. New Mexico State Engineer, Mr. Bliss, informed them at the time that lateral movement of fresh water was not over 2-1/2 ft. per year.

Should you need additional information or desire that Mr. Melvin Neal receive a copy of this letter, please advise.

SUBJECT

Fresh Water - Hobbs Area

Our File No.

Your File No.

TO: Mr. H. D. Page - Tulsa

FROM: Production Hobbs

COPIES: Mr. W. J. Haugh - Tulsa

DATE: June 28, 1957

As requested in your telephone conversation of June 27th, we have obtained additional data on the fresh water in the vicinity of Hobbs. We are also attaching a copy of the map submitted with our report dated June 12th.

The strata producing water is found in the Ogolaga formation which vertically extends from the base of the caliche to the top of the Red Beds. In the vicinity of Hobbs, this water sand is composed of 3 lenses found at a depth of 30-50', 70-100', and 135-160'. In other areas in Lea County fresh water is found as low as 100'. At the present time the NBDOCC is trying to determine if an impervious barrier exists between the lenses. Preliminary work to date indicates no existing one. A map is attached showing the limits of Ogolaga water in the Lea County Water Basin.

In Table I you will find the formation records of Tidewater's water wells on the Grimes and Hardin leases. Both of these wells are producing good quality water and are completed in the 135'-160' strata.

A few years ago, Dowell, Inc. moved their yard, north of Hobbs on the Lovington Highway. They drilled a water well to supply water needed for their operations. This water well is located in NW/4 NE/4 of Section 28, T18S, R38E, Lea County, New Mexico, approximately 1-3/4 miles east from the Getty McKinley lease. The well was drilled to a total depth of approximately 120'. Pipe was set through with cement and perforated. This is a good high volume water well, however, it makes some gas. An oil well, just north of Dowell's well, was worked on shortly after completion of the water well and the gas contamination was decreased considerably. A work-over rig recently moved in to work over the west offset to the above mentioned oil well.

Table II shows the location and total depth of all water wells that have been used by the City of Hobbs. In all cases wells which have been abandoned were done so because of insufficient water volumes. Location of these wells are shown on the attached Hobbs City Map. None of the wells produce above 140' and all produce good quality water. Well #13 near the Dowell has been watched very closely for two years for signs of water contamination, but none has appeared as yet. For the last two months this well has been used for emergency pumping only.

Mr. Dunlavy, Supt. for Skelly Oil, stated that water in the area of Getty's McKinley has been contaminated for 10-12 years, but no definite proof can be found.

Well records on the Grimes, State "B" and Hardin leases have been reviewed and we find that 3 casing repair jobs have been performed, however, one of these wells has since been abandoned. These wells and description of work performed is listed below:

Grimes #2:

- 11-1-46 Found holes in 7" @ 1530 to 2960'. Ran 5-1/2" and set @ 3350' w/ 100 sks. Perforated 3270-72' and squeezed w/ 50 sks.. Perforated 3086-88 and squeezed with 100 sks. Perforated 3148-3255' in Bowers sand for production.
7-6-51 Well abandoned.

Grimes #3:

- 1-1-46 Ran Baker Packer and found holes in 7" casing at 368-373 & 398-403. Squeezed with 120 sks. cement. Drilled out cement. Tested casing w/ 1000# before and after drilling plug. Held okay.

Boone Hardin #3

- 1-12-43 Perforated 7" casing @ 2710 and cemented with 450 sks. Cement circulated between 7" & 9-5/8" cgs. Tested with 1200# before and after drilling plug. Held okay.

In the later part of 1956, a casing leak survey was conducted by the OCC on the three leases and no casing leaks were found.

The data on Hobbs City water wells was obtained from a member of the City Water Board and we were informed that the Water Board was not consulted before action was taken by the City Commission. Some people believe the action to be a "head-line seeking" adventure. This member of the Water Board informed us that for over two years, they had been aware of the problem and had met with the State Water Engineer to discuss financing of water wells away from the city, if and when the present Hobbs supply was contaminated. New Mexico State Engineer, Mr. Bliss, informed them at the time that lateral movement of fresh water was not over 2-1/2 ft. per year.

NEW MEXICO
OIL CONSERVATION COMMISSION
P. O. BOX 871
Santa Fe, New Mexico

MEMORANDUM:

TO: All Operators in the Hobbs, Bowers, and Byers-Queen Pools.
FROM: A. L. Porter, Jr., Secretary-Director
SUBJECT: Protection of Fresh Water Resources.

The Oil Conservation Commission has received a letter from the City Commission of Hobbs, New Mexico, expressing concern over the danger of contamination of the Hobbs municipal water supply as a result of leakage from oil and gas wells in the area.

The City Commission requested this office to call a meeting of all operators in the Hobbs, Bowers, and Byers-Queen Pools for the purpose of determining the most feasible method of protecting the fresh water from contamination.

All operators in the above-named pools are therefore directed to appear at the Office of the Oil Conservation Commission in Hobbs, New Mexico at 10:00 o'clock a.m. on July 9, 1957. Each operator should have at least one representative present who is authorized to speak the policy of his company. Members of the field offices who are familiar with the problem should also be present.

A representative of the State Engineer's Office as well as the members of the Oil Conservation Commission expect to attend the meeting.

All inquiries concerning the meeting should be directed to the Oil Conservation Commission Office in Santa Fe, New Mexico.

JOSEPH O. WALTON

ATTORNEY AT LAW

HOBBS, NEW MEXICO

June 19, 1957

Tidewater Oil Company,
Hobbs, New Mexico.

Attention: Mr. H. P. Shakelford.

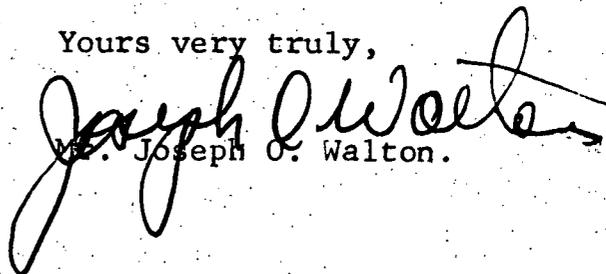

IN RE: NE $\frac{1}{4}$ Sec. 30, T. 18S, R.38E.
Getty McKinley Lease.

Gentlemen:

Mr. W. H. Ellison owns the surface and water rights to a portion of the above described land, and has on several occasions attempted to drill for water for domestic and irrigation purposes. These wells have been found to be contaminated with oil and gas and in an effort to determine whether or not he would be able to obtain uncontaminated water, he has drilled some fourteen wells and has concluded that all of the water underlying his land is contaminated and that this is the result of your operation of the above lease. Demand is hereby made for full compensation of all damages suffered by Mr. Ellison, which we estimate to be approximately \$25,000.00.

I will be very glad to talk with you or your attorney concerning this matter but I have been instructed to take legal action unless some satisfactory agreement can be reached on or before Friday, June 28, 1957.

Yours very truly,

Joseph O. Walton.

City to Request OCCC Hearing For Protecting Water Supply.

Lawyer Displays Samples Showing Pollution by Oil

By VIC JAMESON
Fear that leakage from oilwells may be penetrating this area's water-bearing sands and threatening Hobbs' \$2-million water system last night prompted city officials to seek state corrective action.

City commissioners agreed to apply to the Oil Conservation Commission for a hearing on the case. Their decision came after the "presentation" of evidence by attorneys W. D. Girard and J. O. Walton, indicating that some private wells already contain a heavy concentration of oil.

The problem was brought up by Girard, who appeared before the commissioners in an otherwise routine mid-month meeting. Cited in his discussion was an area about a mile and one-half west of Turner where it intersects with Bender Blvd., on property owned by W. H. Ellison.

A number of tests were made there, around an oilwell that several years ago was found to have a leaky casing, Girard said. Thirteen water wells were drilled around the oilwell, and those south and east of the oil installation were found to have oil in the water, he added.

Girard displayed two bottles of fluid, which he explained came from 80 and 35 foot wells in the area concerned. Both contained liquid that appeared to

Two small children were struck by automobiles in separate accidents here yesterday. One child was admitted to Lea General Hospital and the other was released after emergency treatment.

The first mishap occurred at 5 p.m., when Gloria Gail Jackson, 4-year-old daughter of Mrs. Grace Wilburn, dashed into the path of a passing automobile in front of her home at 904 East Humble. The child was taken to Lea General where she was admitted for treatment of cuts on her face and scalp. Her condition today was described as "good."

Driver of the vehicle, a 1957 Chrysler station wagon, according to a police report of the incident, was Mrs. Tom Mason of 301 Yucca Drive.

The second accident involving a pedestrian occurred at 6:48 p.m., when 7-year-old Larry Fisher, son of Mr. and Mrs. F. E. Fisher, 320 West Palace, attempted to cross Palace, while a heavy rain shower was falling.

Mrs. Jones Rathke, 303 West Cattle, driver of a 1949 Plymouth, told police she was unable to see the youth as he dashed in front of the car.

He was taken to Lea General where he received emergency treatment for abrasions on his legs.

No citations were issued in either incident, police reported.

Sketchy Rain Dumps Heavy Fall on Tatum

Gypsy-hearted rain skipped across Lea County yesterday with up to 2 1/2 inches in some sections, and the flirtatious showers held promise of coming back this afternoon.

The wandering thundershowers dumped their heaviest concentrations in the Tatum area, skipped Lovington almost completely, and faded again as they moved south to Eunice and Jax. Eunice got a shower Jul a bare trace.

Moderate to high wind and some hail accompanied the rains but no extensive damage from either was reported.

Downtown Hobbs recorded 33 inch, the Civil Aeronautics Administration station at Lea County Airport .55. Cloudy skies were forecast here throughout the day, and possible afternoon thundershowers were in the offing.

An even inch of rain fell in Tatum, said Mrs. E. J. Fox, with heavier amounts in the surrounding areas. Falling mostly in slow and moderate fashion, the rain left 1 1/2 inches at the Russ Anderson ranch southeast of Tatum, an inch at the Byron Post ranch to the northwest, 2 1/2 inches at the Roy Feeler ranch to the southwest, and 1/2 inch at the W. D. Baum ranch south of Tatum.

Small hailstones fell in the Tatum area but, Mrs. Fox said, they caused no heavy damage.

Oil Center recorded .52 inch. At Lovington, weather observer E. W. Myers said, "the light shower amounted to about three

Estelle Moss Is Dead at 46

Estelle Moss, 46, died at her home in Hobbs Tuesday morning after a long illness. She was born in Texas and had lived in Hobbs for many years. Her husband, John Moss, survives her.

Police Rescue Child Missing From Lubbock

SWEETWATER, Tex. (AP) — A woman and an 18-month-old Lubbock boy who had been missing for 12 hours were picked up by police today at a bus station here.

The boy, Lowell Russell McDonald, wandered away from his mother yesterday while she shopped in a Lubbock variety store, setting off a 12-hour search.

Patrolman Charlie Henderson said the boy was identified by his father, L. R. McDonald, who came here with two FBI agents.

The woman, identified herself to police as Mrs. Kullia Wilson of 2308 9th St., Lubbock but declined to make any further statement. She was returned to Lubbock.

Sweetwater police identified her as a divorcee, 33 who had worked in the Lubbock store until recently.

Henderson said the boy and his father were returning to Lubbock with the FBI agents and the woman.

No charges had been filed.

Police checked the bus station after being notified from Lubbock that the boy was missing and a woman and boy had been seen boarding a bus in Station, 18 miles southeast of Lubbock, late yesterday.

"I saw her sitting on a bench in the station. The boy was beside her and was asleep," said Police Sgt. J. H. Rushton.

Rushton said the woman first told officers it was her own child, but later said she picked up the baby in the Lubbock store when she saw it crying. She said she told the boy she would help him find his mother, officers reported.

Supreme Court Draws Fire on New Decisions

WASHINGTON (AP) — Two new Supreme Court decisions in the field of communism today set off congressional criticism of recent rulings of the high court.

Rep. Howard W. Smith (D-Va.) said the 1940 antisubversive law which bars his name is "perfectly clear" in its intent. He suggested there is no use trying to amend the statute so long as the present law turns into "whatever the present court interprets it to be."

Sen. Jenner (R-Ind.) said he is afraid the court has "put us back where we were 20 years ago" in the "legab battle against Communists."

Smith and Jenner referred in interviews to yesterday's Supreme Court decision overturning 6-1 Smith Act convictions of 14 California Communists. Five were freed and new trials ordered for the other nine.

In a second ruling, the court struck down the contempt of Congress conviction of labor official John T. Watkins. Here too the vote was 6-1 with Justice Clark dissenting in both decisions.

Watkins had been convicted of contempt of Congress for refusing to tell a House Un-American Activities subcommittee in 1954 the names of former Communist associates. Watkins said he was not a Communist but he acknowledged having worked with some Communists in the labor movement.

Chief Justice Warren said the question under subcommittee inquiry was "obscure" and was not adequately revealed to Watkins when he had to decide at his peril whether or not to answer.

Probers Flay Court Ruling

SAN FRANCISCO (AP) — The House Un-American Activities subcommittee opens hearings today, asserdely, undeterred by the suicide of a witness and by three Supreme Court decisions which may affect congressional investigations.

"Not a bit of it," said Chairman Walter (D-Pa.) when asked of the newsmen if his conduct of yesterday's U.S. Supreme Court decisions, including one which cleared a labor organizer of contempt charges for refusing to name former Communist associates.

Did he think the decisions might be a warning to go slow in his probing?

"Not a bit of it," repeated Wal-

ter. "About 50 witnesses have been (Continued on Page 9)

Cigarette Price Goes Higher

Cigarette prices are expected to rise further due to increased costs of raw materials and labor. The price of a pack of cigarettes is now around 15 cents.

Chief Justice Warren said the question under subcommittee inquiry was "obscure" and was not adequately revealed to Watkins when he had to decide at his peril whether or not to answer.

came from 30 and 35 foot wells in the area concerned. Both contained liquid that appeared to be nearly completely oil.

The oil apparently is that which leaked from wells in the past, before casing leaks were discovered and corrected several years ago, Girard said.

"The leaking wells have been sealed off now," he explained.

(Continued on Page 5)

Four Arrested In Brief Chase

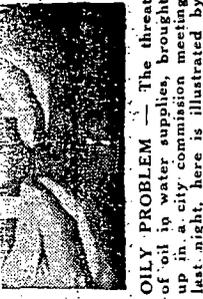

Four persons—the driver and three occupants of a car—were taken into custody last night following a brief chase.

A police report of the incident said the car first was spotted by a patrolman as it turned off Mainland onto Turner at high speed. The policeman started in pursuit as he saw the other vehicle following while it proceeded north.

Turner. Aware that he was being pursued, the report said, the driver put his car in a lower gear and attempted to outrun the patrol car. The car was whipped into an alley in the 100 block on South Turner and it was stopped there by police in the patrol car.

Police said a partially consumed fifth of whisky and 18 cans of cold beer were found in the car. These had overturned and the contents spilled out on the floor boards.

Driver of the car, Charles M. Hamilton, 20, of 513 North Linn, was booked for driving while intoxicated. He was held. The other three occupants were booked for drunk. They are Robert Wayne (Mueh) Green, 18, Arthur Earl Havens, 20, of 213 East Midwest, free after posting bond of \$15, and Kenneth Lee Allen, 18, of Abilene, Tex., free on \$15 bond.

Woman Sentenced In Larceny Case

Mary Martin, 46, yesterday was sentenced to 1-10 years in the state prison after being found guilty of grand larceny. She was tried before District Judge John R. Brand of Hobbs in a district court session at Lovington.

Miss Martin was charged with having taken more than \$300 from the Russ Anderson ranch near Fatum, while working there as a housemaid. The incident occurred June 4, 1936. The sheriff's department reported.

Also sentenced yesterday was Esker Cohaggins, charged with driving while intoxicated. He was sentenced to 30 days in jail after being found guilty on the charge.

At Lovington, weather observers E. W. Byers said the light shower amounted to about three drops. A brief trace was recorded, although wind there was very heavy for a while.

A light shower fell at Eunice. Heavier rain appeared to be falling west of Eunice, observers there said.

Jal, too, got only a trace of rain, just enough to wet your shirt," reported observer K. B. Walker. Fairly heavy showers appeared to be falling north of Jal, he said, and more extensive rain also apparently fell east of the community.

The heaviest rain here fell late yesterday afternoon, with another trace recorded this morning. Temperature dropped from a high yesterday of 92 to a low this morning of 61, and thermometer was not expected to pass the 80 level today. Wind from the south and southeast yesterday blew up to 37 miles an hour, with gusts to 55 miles.

Sinclair to Boost Gasoline Price

NEW YORK (AP) — Sinclair Refining Co. today announced it will increase its prices two-tenths of a cent a gallon on all grades of gasoline, kerosene and distillate fuels, effective June 21.

It will also boost residual fuels 5 cents a barrel. The boosts in gasoline, kerosene, distillate fuels and residual fuels apply to the company's 36-state marketing area.

Sinclair said the price boosts were an essential step to recover the added labor costs arising out of its "new agreement with the AFL-CIO Oil, Chemical & Atomic Workers International Union.

The new agreement was reached June 14, the company said, and provides a general wage boost of six per cent together with certain improvements in benefits and vacation and holiday pay. It will run for two years.

Funeral rites are set tomorrow at 3 p. m. for Mrs. Estelle Moss, long-time Hobbs resident who died yesterday afternoon in a local hospital. Mrs. Moss, 46, had been in failing health for some time.

Services are set at the Calvary Baptist Church with the Rev. Truett Allen, pastor, officiating. Burial will be in Prairie Haven Cemetery. Griffin Funeral Home is in charge of arrangements.

Mrs. Moss is survived by her husband, W. M. Moss of 1303 East Dunham, an oilfield worker here for about 15 years; two daughters, Mrs. Jane Gun and Mrs. Doris Sparger, both of Hobbs; her father, J. J. Reed of Pittsburg, Tex.; one brother, Edgar Reed, also of Pittsburg, and two grandchildren.

Palbearers will include W. H. Fair, J. W. Hunter, Dr. W. E. Badger, Douglas Buckner, Aron Fair, D. T. Gilmore, C. C. McWilliams and T. T. Tipton.

New OCC Building Uses Hobbs Plans

A new Oil Conservation Commission district office to be built in Aztec will be constructed from plans designed for the Hobbs district OCC office building erected here several years ago.

The proposal to use the Hobbs office blueprints for the new \$55,000 Aztec structure was revealed this week by A. L. (Pete) Porter, secretary-director for the commission. The original plans were by a Hobbs architect, R. L. Wham.

The new OCC structure in Aztec, containing approximately 3,000 square feet on floor space, will be erected near the Aztec Farmington highway on the road to the Aztec ruins.

Porter said use of the existing plans is expected to save money for OCC. The new structure, to contain a reception room, file room, six offices, a supply room and a conference area, will be started about Aug. 1, Porter said.

told the boy, she would help him find his mother, officers reported. "Then," she said that later she decided to keep the baby," reported patrolman C. E. Wilson. "She went to Slaton and bought a ticket for Fort Worth. She told me that after she got on the bus, she realized what she'd done and started wondering what would happen to her."

Wilson took the boy home with him for a meal and a few hours sleep before his father arrived with the agents.

Improvement Noted In Condition of Paralyzed Teacher

Some improvement is believed noted in the condition of a paralyzed Hobbs teacher, stricken while attending summer school at Peabody College in Nashville, Tenn.

The victim is Gene Powell of 1204 Llano Drive, an English teacher and student counselor at Hobbs High School. Friends and relatives here said his condition had been termed "critical" by attendants in the Vanderbilt Hospital at Nashville, where he is confined.

Mrs. Louise Powell, his wife, who had remained at their home here, learned of her husband's illness Saturday morning, when he was discovered in a paralyzed condition in his room. She left immediately for Norman, Okla., where Powell's parents live, driving through the rain there, she flew to Nashville.

First reports here were that Powell was completely paralyzed except for a portion of his left side. He is unable to speak or communicate with any one.

A telephone call from Mrs. Powell in Nashville today to relatives here revealed some slight improvement in the high school teacher's condition in that some movement had been detected in his right side, it was reported.

Powell is about 35 years old, friends said. He and Mrs. Powell are parents of two children, Pamela, 6, and Steven, 3. The two children accompanied Mrs. Powell to their father's bedside. They are returning by plane to Hobbs today to stay in the home of Mr. and Mrs. Kenneth A. Kappan, 1834 Chama Drive. Mrs. Kappan is a sister of Mrs. Powell.

ALBUQUERQUE (AP) — New Mexico smokers will pay a cent a pack more from now on for non-filter tip cigarettes.

Cigarette wholesalers here who distribute most of the cigarettes sold in New Mexico, say they will pass on to retailers a 35 cent per thousand raise in wholesale prices, which works out to about a cent a pack retail.

Five major tobacco companies announcing price hikes are American Tobacco Co., Liggett & Myers, P. Lorillard & Co., Philip Morris and R. J. Reynolds.

Filter-tips are not affected. Under the new price sale, wholesale prices per carton will be \$2.42 and \$2.52. They were formerly \$2.34 and \$2.44.

Retail minimums under the law will be now .25 and .26. They were formerly .24 and .25.

The tobacco companies blamed advertising costs of tobacco, labor and rising costs for the price hikes.

Improvement Noted In Condition of Paralyzed Teacher

NEW MEXICO: Partly cloudy east and south central portions today through Wednesday. Occasional showers and thunderstorms southeast today through Wednesday. Windy scattered afternoon and evening thundershowers north-east and south central portion today. Fair west today and north-west Wednesday. Little warmer northeast Wednesday.

HOBBS: Partly cloudy and a little cooler today through Wednesday. Occasional showers and thundershowers, mainly afternoons and nighttime. Some chance for a locally heavy thundershower in the vicinity. Low tonight, 62.

Yesterday: 11:30 a. m. 85, 12:30 a. m. 67, 1:30 p. m. 89, 2:30 a. m. 61, 3:30 p. m. 90, 4:30 a. m. 63, 5:30 p. m. 86, 6:30 a. m. 67, 7:30 p. m. 66, 8:30 a. m. 69, 9:30 p. m. 71, 10:30 a. m. 63. Precipitation 55 at Airport, 33 in the city.

when he had to decide at his peril whether or not to answer Warren's said the Un-American Activities group "dearly" unfairly with Watkins. At another point he said there is no congressional power to "expose" for the sake of exposure. And he criticized as loosely worded the resolution under which the Un-American Activities Committee was set up.

Attorneys for Arthur Miller, playwright husband of actress Marilyn Monroe, promptly expressed indignation.

Plea of Not Guilty Made to Charges In 'Mistake' Attack

Ira H. Bingham, 29, yesterday pleaded innocent to charges of assault and battery at arraignment before Peace Justice Robert L. Bensing. His hearing was set for tomorrow at 2 p. m. and bond was set at \$500. He was held.

Bingham was charged in connection with the beating of a 17-year-old youth, Garvin C. Hill of Semmore, Tex., early Sunday morning at a state line tavern, five miles east of Hobbs. Hill was taken to a General Hospital where he was admitted. He still is in the hospital receiving treatment in head injuries.

A deputy sheriff, J. C. (Jake) Fort, quoted Bingham as saying he had the right Hill was the same person who wrote a \$26 check on him in Odessa, Tex., earlier. However, Fort said, it apparently was a case of mistaken identity as Bingham thought Hill was a man named "something like a Kitchener."

and pick up some other opposition due to his controversial in the Demo floor leadership in the recent legislature.

LENS FAVOR CK AND MECH — The Demo's at this point are for Seven-Pop Pickett who has an undeniable appeal to a lot of voters—that's in the Demo camp—and for Gov. Ed Mech in the November round.

Mechem is lucky. He has been trying on like he didn't give a rat about the next election. Republicans are approaching about the unity in and a considerable number of Democrats who help him last November have gone but Mech will be all right as the Demo mount a strong assault than appears in the are at this time. Republicans in New Mexico only when Democrats are divided and any point they haven't shown any of getting together behind a congressional candidate for the gubernatorial challenge.

MECH DRIVE HUNDEKIRK — The Pat Hurlbreds are enjoying Santa Fe sun in a new Thunder. Karl Guchmann, who (Continued on Page 5)

no Others Fired om EDC Posts ANTA FE (AP) — A spokesman for Gov. Edwin Mechem said men had been removed from the New Mexico Economic Development Commission. He said "notices of termination" had been sent by Mechem to Army Wise of Hobbs, an oilator and former Democratic leader; William Nellis of Los Alamos and M. W. Smith of Albuquerque.

He said he did not know the actual affiliation of Nellis and the governor's spokesman said letters of termination stated: "You will serve as official representative of your membership on the New Mexico Economic Development Commission." Reasons for the action, were said, and the governor's spokesman said he did not know the reasons were let out.

He also said he did not know the positions would be filled again.

moon-laden-ship deck with a quiet girl and a noisy sea? The warmth of comradeship that springs up voluntarily among people who find themselves together for the first time? How can I express the sense of awe at seeing ocean swells larger than our ship? How can I express the feeling of reverence while watching the sleek, white and ebony swallows that glided along behind the ship for hours at a time?

The answers are simple: I can't. I can only report these experiences and ideas, and then hope that through your imagination and experience, you may realize some value from this writing.

We were told that the S. S. Arcturion was a student ship.

Danny Wise and His Friend Realize Their First Goal

(One of a series, written especially for The News-Sun, by a Hobbs youth on a student tour of Europe.)

By DANNY WISE — After PLYMOUTH, England — After months of working and saving, weeks of thinking to the turning of our nation's northern pin, days of listening and listening to music and the sea, Phil Daniel and I have realized our ambitions of seeing Europe! It is ironic that we should land in Plymouth; for actually all began fight here—this European venture, my family, your home, our America. It all began with the sailing of the Mayflower from this famous "debarcation point

At Levington, weather observers E. W. Byers said the light shower amounted to about three drops. A brief trace was recorded, although wind there was very heavy for a while.

A light shower fell at Eunice. Heavier rain appeared to be falling west of Eunice, observers there said.

Jal, too, got only a trace of rain, just enough to wet your shirt," reported observer K. B. Walker. Fairly heavy showers appeared to be falling north of Jal, he said, and more extensive rain also apparently fell east of the community.

The heaviest rain here fell late yesterday afternoon, with another trace recorded this morning. Temperature dropped from a high yesterday of 92 to a low this morning of 61, and thermometer was not expected to pass the 80 level today. Wind from the south and southeast yesterday blew up to 37 miles an hour, with gusts to 55 miles.

Funeral rites are set tomorrow at 3 p. m. for Mrs. Estelle Moss, long-time Hobbs resident who died yesterday afternoon in a local hospital. Mrs. Moss, 46, had been in failing health for some time.

Services are set at the Calvary Baptist Church with the Rev. Truett Allen, pastor, officiating. Burial will be in Prairie Haven Cemetery. Griffin Funeral Home is in charge of arrangements.

Mrs. Moss is survived by her husband, W. M. Moss of 1303 East Dunham, an oilfield worker here for about 15 years; two daughters, Mrs. Jane Gun and Mrs. Doris Sparger, both of Hobbs; her father, J. J. Reed of Pittsburg, Tex.; one brother, Edgar Reed, also of Pittsburg, and two grandchildren.

Palbearers will include W. H. Fair, J. W. Hunter, Dr. W. E. Badger, Douglas Buckner, Aron Fair, D. T. Gilmore, C. C. McWilliams and T. T. Tipton.

NEW YORK (AP) — Sinclair Refining Co. today announced it will increase its prices two-tenths of a cent a gallon on all grades of gasoline, kerosene and distillate fuels, effective June 21.

It will also boost residual fuels 5 cents a barrel. The boosts in gasoline, kerosene, distillate fuels and residual fuels apply to the company's 36-state marketing area.

Sinclair said the price boosts were an essential step to recover the added labor costs arising out of its "new agreement with the AFL-CIO Oil, Chemical & Atomic Workers International Union.

The new agreement was reached June 14, the company said, and provides a general wage boost of six per cent together with certain improvements in benefits and vacation and holiday pay. It will run for two years.

Oil Imports
 Crude oil imports into the United States are expected to reach 1,165,000 barrels a day in the third quarter of this year. This would be an increase of 12 percent over the corresponding period in 1956, and more than 400,000 barrels daily above the 1954 relationship to domestic production.
 President Eisenhower has been represented as advocating some curb on crude oil imports, but so far he has done nothing to reduce them or even hold them at their present level.
 In fact, since a Cabinet committee recommended three years ago that imports be held to their 1954 ratio to domestic production, foreign oil shipments into this country have doubled.
 Lea County has a large stake in this matter, for the rising flood of foreign oil can ultimately result in production cuts for Lea and the rest of the Permian Basin.

STRONG WORDS
 Rep. Gordon H. Scherer, Ohio Republican, is exceedingly dissatisfied with the surprising U. S. Supreme Court decision yesterday which set free five convicted Communists and ordered new trials for nine others.
 In an astonishing ruling, the court reversed the verdicts of two lower courts which after long hearings had found the 14 Reds guilty of conspiring to advocate the violent overthrow of the U. S. government. There was no question that the 14 were given fair trials, but the Supreme Court turned five loose and ordered new hearings which very well could result in the freeing of the other nine.
 Like many another American, Representative Scherer was upset. If the Supreme Court decision stands — and there's no reason to believe it won't — then the FBI and congressional investigating committees might as well close up shop, says Scherer.
 In a bold criticism of the highest court of the land, Scherer added:
 "We have just turned the country back to the Communists with these decisions."
 Communists will rejoice, but Americans will not be happy at this newest strange decision by the U. S. Supreme Court.

WEIGHTY MATTER
 Roderick the Roughneck says his wife weighs a hundred pounds.
 Roderick the Roughneck says his wife weighs a hundred pounds.

House Passes Civil Rights

WASHINGTON (AP)—The House today passed President Eisenhower's civil rights bill. The House defeated the measure 251-158. Southern bloc's fourth and final attempt to drive a jury trial amendment into the measure. The vote insured passage of the bill essentially in the form Eisenhower recommended and the Republican, Northern and Western Democrats backing such legislation agreed on.
 Voting for the jury trial amendment were 45 Republicans and 133 Democrats. Against it were 119 Republicans and 112 Democrats. The bill now goes to the Senate where a bipartisan coalition is trying to rush it on to the calendar for action, thus depriving Southern senators of one of their opportunities to filibuster.
 Senate Republican Leader Kenneth C. Culberson said he is prepared to take "whatever steps necessary" to get Senate action on the message this session.
 The bill would authorize the U. S. attorney general to take into federal court the cases of persons whose voting or other civil rights were violated or threatened.
 Without first going to state courts, the attorney general could seek a federal injunction against such violations. If it were granted, the court then could punish for contempt anyone who violated the injunction, but proponents of the bill have argued that the granting of the injunction itself would often eliminate the difficulties.
 The bill also would provide for a bipartisan commission to make a two-year investigation of civil rights complaints and for a special division of the Department of Justice, under an assistant attorney general, to handle civil rights matters.
 The vote on the jury trial amendment was the first during long House consideration on which House members were recorded by name.
 Knowland made his remark about taking whatever action is needed to renege on the White House after he and other GOP congressional leaders had held their weekly conference with Eisenhower's attorney general.

Let George Do It With Four Jobs!
 PITTSBURGH, Pa. (AP)—In this birthplace of the oil industry, George Do It With Four Jobs!

Danny Wise

(Continued from Page 1)
 had best the university in Britain. Also to our great disappointment we found about 40 female students and over 40 male students. Anyway, we enjoy reading. We also enjoy talking, but I felt very out of place in some of the conversations. There were psychology students from Princeton, philosophy students from Yale, a French student going to the Sorbonne in Paris, medical majors from Texas, and physical education students from Toronto. Although some of them were quite intelligent, the conversationalist that Phil and I liked best was an intelligent, thoughtful, apparently athletic, Englishman we knew simply as Johnny. Johnny had a pronounced Cockney accent. He is a muscular well-built man of 26 who has not yet acquired the "civilized" adversity to heavy labor. He could nearly always be found on deck and on being drawn into a conversation, he would speak quietly and fondly about nature, people, and his family—the usual things. Yet he spoke with an intelligent love and devotion for those things, so that he demanded our greatest respect.
 One night as we stood on deck Phil mentioned that had we been in the same spot 12 years ago, instead of serenely enjoying the eternity of eagle moon, enemy subs, and exaggerated sounds, it seemed very strange, in that beautiful setting, that men could kill one another. It seemed strange still when I thought of the German crew and Italian sailors (on our ship). And now, because I happen to come 10 years later than some of you I can give them a friendly slap on the back instead of a deadly bullet in the head. And the world has buried her dead and said, "Thank God we're civilized!"
 If we weren't talking or playing cards we were eating food or listening to the ship's band. Both were quite a treat but both got too old too soon. The band seemed to play constantly in one of the three bars or in the drawing room. They made a stab at everything, but they could play Hungarian folk songs and classical music.
 It would not be fair to say that we did not like the food—we just got tired of eating. The room steward woke us up every morning just in time to go to lunch. Getting through lunch was a major victory, not because the food was poor but because it took a certain amount of skill and finesse to get through a four-course meal on a pitching ship. Not only the big social event of the day, but it also took on an atmosphere of a great sporting event. Bu tea time, 4 o'clock the only digestion that had taken place was done by the ships.

Bomb Testers Flee Fallout

ATOMIC TEST SITE, Nev. (AP)—Atomic scientists fled their fourth series at 4:45 a. m. today. Then they fled.
 The Atomic Energy Commission said light fallout from the blast forced evacuation of the test site control point.
 The device—detonated from a balloon hung 500 feet above the desert floor—lit up the following five minutes later the following mushroom cloud. His almost six miles, began to drift toward a containment toward the control point.
 The order to evacuate was given 15 to 20 minutes after the point was empty. It is about eight miles from the test site.
 An AEC spokesman said the upper part of the cloud headed north of due east at 30,000 feet. The stem drifted north of due west at 20,000 feet.
 More than 50 diagnostic tests were conducted as a part of this morning's test. Live pigs and mice—with recording instruments on their bodies—were used in studies of radiation.
 The blast today was estimated by 10 kilotons, the same size as the 10 kiloton shot which launched the test series earlier this month. A kiloton is the equivalent of 1,000 tons of TNT.
 The last two shots were much smaller—perhaps two kilotons. No troops took part in today's test, although more than 30 military planes support missions and nearby on-suppress missions and indoctrination flights.
 Los Angeles reported today's shot—clearly visible—appeared as a brief, blue flash.
 In Las Vegas it seemed very bright but of briefer duration than some previous major detonations. Observers on Angel's Peak, closest spot newsmen were allowed to the test area, said that from 55 miles away it appeared that the explosion kicked up dust on the floor of the desert.
 Today's test originally was set for June 8 but delayed again and again by unfavorable weather conditions.

but we have no way of knowing how much oil polluted the water sands before they were corrected.
 Oil that leaks into water-bearing sands could "migrate" into central areas and eventually be pulled into the city's water system, the officials theorized. They said, could foul the entire system which now represents an investment of about \$2 million. Further evidence in the situation was presented by Walton, who said oil in a water supply has "ruined three laws" for G. W. Goins, who lives in the same area. City Attorney Donald Hallam was instructed to seek a hearing on the OCC in the case.
 Routine business took up the remainder of the meeting. The commission.
 Approved payment of \$12,186.66 in regular bills and \$23,739.22 in water department bills. Olayed refunds totaling \$101,267 for overcharges in paving projects.
 Discussed methods of payment for occupational taxes.
 Heard a report from Commissioner Walter Lynam on improper drainage at the south end of South Third Street, and was told that this and similar faults will be corrected after the completion of surveys now under way.
 Approved a resolution asking approval from the state board of finance for the purchase of three adding machines.
 Olayed a bid by Lembeck, Clough and King Construction Co., for building foundations for an elevated water tank at a cost

20-30 Governor Will Visit Hobbs

GAIL J. RAY, governor of the New Mexico District of 20-30 International, will pay an official visit to the 20-30 Club of Hobbs at its weekly meeting Wednesday. Ray, party manager of Hart Motor Co. in Artesia, has just received his nine year perfect attendance pla from his local club. He completes his term as governor of the New Mexico District this month.
 Primary purpose of his visit will be to review the past year's

Hospital Notes

Patients admitted Monday to Lea General Hospital:
 Albert Clark Masterston, 1307 South Selman.
 Emma Novella Choide, 1008 East Humble.
 Naomi L. Lee, 2603 North Street.
 Ernest Tipton, Hobbs.
 Anita Cortez, Hilaria, 145 Elm Blvd.
 Winifred Maxine Reynolds, 210 East Jackson, Lovington.
 Mary Ann Parker, 104 West Texas.
 Bobbie Sue Young, 500 East Dunham.
 Gail Jackson, 904 East Humble.
 Virginia Ann Johnson, 107 East Monroe, Lovington.
 George Ellis Bush, 505 East Park.
 Reta Dossey, Eimice, 1807 East Humble.
 Earl Dean Selman, Seminole, Texas.
 Patients discharged Monday:
 Raleigh Koscoe Sims, Eunice.
 Margaret Maxine Swartwood, Eunice.
 Mary R. Moreno, 412 South Fourth.
 Ida Muriel Russell, 206 West Roxana.
 Yvonne E. Turner, 619 East Marland.
 Earl Windel Maybure, 1508 Marland Drive.
 Mary Navaro, Hobbs.
 Thomas John Duffie, Hobbs.
 Emergencies treated:
 Frank Burleson, 318 East Midway.
 Larry Fisher, 320 West Palace.
 L. R. Gaultney, 318 North Dallas.
 Further south in Marland, Akron, Iowa, a farmer's wife wanted to move stock from her lands onto higher ground.
 In Nebraska, fresh rain flooded the Blue River, watershed where it caused damage estimated at \$10,000. There were no injuries reported.
 Funnel clouds were sighted central Iowa late yesterday touched ground at Marshalltown, Iowa, where it caused damage estimated at \$10,000. There were no injuries reported.

June Tenth Here Will Be Quiet One

Tomorrow—June 19—is Emancipation Day for America's Negroes but no celebration of the occasion is planned here, it was revealed today.
 A spokesman here said that the holiday—often called "Juneteenth"—today is observed "arely outside of Texas, where it still is a popular time for celebration."
 The date marks the signing of the Proclamation of Emancipation by President Lincoln (it realigned the status of slaves in the states then in rebellion to be "then, henceforth, and forever free." A preliminary proclamation had been issued earlier on Sept. 22, 1862.
 "Outside of Texas, few Negroes recognize or observe Emancipation Day now. Most of them would

Eastern U.S. Sweifers for Another Day

Most of the nation's east half awoke to another torrid day today after sizzling temperatures that set records yesterday.
 At the edge of the swelter, there were hot and cold air clash where severe thunderstorms and some tornado activity. The Weather Bureau in Chicago said the mercury would rise to the 90s for another day of hot humid weather.
 It was because of the torrid temperatures yesterday that Chicago and New York suffered power shortages. This occurred in rush for air-conditioning relief.
 Record temperatures were for June 17 at Philadelphia, which it reached 98. Newark, N. J., Chicago's 96 equaled the high the date, established in 1887.
 The hottest spot in the nation was Presidio, Tex., where a high of 108 was reported.
 Forecasters said temperatures in the 90s would be repeated the eastern half of the country.
 The demarcation line of warm air in the central and northern parts of the country was pepped with thunderstorms which curved from the Texas-Palmer northeastward through the Ohio Plains and the upper Mississippi Valley.
 Swollen rivers and creeks, spilling from banks and gushing into great walls of surging water, were fed by torrential rains over the weekend. Southwestern, Minnesota and eastern South Dakota county at least five deaths due to flooding. Communities in the strict areas braced for further outbreaks as tributaries poured water into the Redwood River, Minnesota, and the Big Sioux South Dakota.
 Further south in Maryland, Akron, Iowa, a farmer's wife wanted to move stock from her lands onto higher ground.
 In Nebraska, fresh rain flooded the Blue River, watershed where it caused damage estimated at \$10,000. There were no injuries reported.
 Funnel clouds were sighted central Iowa late yesterday touched ground at Marshalltown, Iowa, where it caused damage estimated at \$10,000. There were no injuries reported.

Highway Markin To Require Year

SANTA FE (AP)—A. Koffhe State Highway Department, said it will take at least a year to just the state's highway system the new speed limit law.

Drew Pearson

Washington Merry-Go-Round

WASHINGTON—By an ironic twist which the general public doesn't realize, George Humphrey is stepping out as secretary of the treasury just as the treasury is in one of the worst messes in recent history.

To quote the Wall Street Journal: "The government of the United States is in a fiscal mess. The treasury of the richest nation on earth is short of money. At one point this spring it had nearly enough cash to pay a week's worth of bills."

Yet Mr. Humphrey has been hailed as the strong man of the cabinet and one of the greatest secretaries of the treasury in history.

The fact is, however, that victory bonds have been selling at \$86, the same panic levels at which millions of people sold and took their losses on liberty bonds after World War I. In addition, the treasury's interest rate for long-term bonds is at the highest point in history, despite which the bonds can't be sold to the public.

The recent \$4,200,000,000 bond offering at a 5 7/8 percent for 37 months was a complete bust. The investing public just wouldn't buy.

On top of this the treasury has to raise \$55 billion to cover maturing bonds in the next 12 months. Yet it has now given up all hope of raising money through long-term bonds and gone back to short-term notes.

One of the big campaign issues of the Eisenhower administration was to get away from short-term, hand-to-mouth financing. To accomplish this, one of the leading businessmen of the nation, George Humphrey, was made secretary of the treasury, while the actual job of revising fiscal policy was put under Randolph Burgess of the National City Bank, a strong critic of the government's past bond policy under Henry Morgenthau.

Burgess is married to a great-great-granddaughter of Alexander Hamilton, first secretary of the treasury and the father of American fiscal policy.

One of the first things Burgess did was announce that he would take \$170 billion of the government's debt and put it away in long-term bonds for 20 or 30 years.

To please the bankers, he also jacked up interest rates. This was his worst mistake. After he had liked interest rates on one bond issue, he couldn't go back to low-

er rates on other issues. The bank and the investors wouldn't take it.

So the crest of handling the national debt today, because of increased interest charges, is about the same as the cost of the entire government budget during the peak days of WPA and PWA. And many business leaders were denouncing the high cost of government.

Meanwhile, the government has enough money to last through June. But \$4 billion will be needed in July. In August, the treasury faces another \$15 1/2 billion in maturities, with another \$8 billion in October. Though part of these are held by the Federal Reserve, at least \$9 to \$10 billion are in public hands.

These public investors are finding that they can get a better return from the stock market or in municipal bonds. They don't like having their money tied up in long-term government bonds when the value of the dollar is dropping. As long as inflation continues, the treasury will face an almost impossible problem of floating its loans. No wonder George Humphrey is anxious to exit as secretary of the treasury.

You can't prove it, but it looks as if the Navy had decided to retaliate against congressional economists. It has ordered an abrupt close-down of the Elizabeth City, N. C. naval station.

This naval station is in the district of North Carolina's Herbert Bonner, chairman of the House Merchant Marine and Fisheries Committee and a leading budget-cutter. His votes have been considered anti-Navy.

You can't get anyone at the Navy Department to admit this, but it seems highly unusual that the Elizabeth City Naval Base should be closed, for two reasons:

1. It is a blimp base used by patrol the Atlantic coast for submarines; and more Russian subs have been lurking off the coast than ever, watching guided missile operations.
2. Elizabeth City happens to have the only two hangars that can accommodate the new blimps

George deWitt, the Council appointee of George W. Becker to fill a vacancy as controller.

George also is city clerk, deputy director of accounts and finances, and special tax officer. His combined annual income is \$6,090.

ordered by the Navy. When they are delivered, they'll have no place to go except Elizabeth City—unless new hangars are built, which could certainly be no economy.

If you ask anyone at the Navy about this, all you get are smiles. However, it certainly looks as if Congressman Bonner is getting slapped and slapped hard.

NOTE—The cost to Elizabeth City will be a \$3,000,000 Navy payroll. Other areas around the U.S.A. are beginning to learn what budget-pruning means, as other military facilities are closed down.

Supreme Court

Supreme Court (Continued from Page 1)

pressed the view that the Watkins decision had application to Miller's contempt of Congress case. They said they would move in U.S. District Court here today for reversal of Miller's conviction.

Miller was convicted of contempt of Congress May 21 for refusing to tell the Un-American Activities Committee the identity of Communist writers he acknowledged knowing in New York in 1947. He has not been sentenced.

In the case involving the California Communists, the 14 were convicted under the Smith Act in 1952 of plotting to teach and advocate violent overthrow of the U.S. government.

Justice Harlan, writing for the majority, said "preaching abstractly" the forcible overthrow of the government is no crime under the Smith Act.

"The essential distinction," he said, "is that those to whom the advocacy is addressed must be urged to do something now or in the future, rather than merely to believe in something."

Smith said bitterly, "I do not recall any case decided by the present court that the Communists have lost."

Jenner, senior Republican member of the Senate Internal Security subcommittee, said: "It seems to me that the opinion means the

more apparent. Those who would not admit defeat, yet were subjected to another bombardment of food, supplemented with little encouraging remarks by our large waiters.

The only breakfast we got in on was Sunday morning (June 10) at 6 o'clock. It was a fine day, our first morning on board. We ate, then we filled our packs with the squat little buns that make excellent weapons. If the owner is outnumbered and at a good distance. Then, the buns may be eaten, if the outer crust can be broken through.

When we had finished with our breakfast, and immigration had finished with us, we were allowed to walk, free men, the streets of Plymouth.

less they grovel before the subcommittee," he asked.

Sherwood, who leaves a wife and four children, was found dying in his laboratory late Sunday night by his wife Barbara, who had not believed his statement when he left the house, that he was going to "end it all," the swallowed poison.

Sherwood said from what he read "he was afraid he would have to go to jail. I don't know why he reached that decision unless he had an idea that we knew what we know regarding his activities."

subpoenaed. The committee will probe possible Communist influence on the professional and entertainment fields.

"It seems the court leaned over backwards to make it more difficult for our committee to perform the duty imposed upon it by Congress," said Walter.

He and committee member Rep. Gordon H. Scler (R-Ohio) agreed that if the high court decision stands, "the FBI and the investigating committees may as well close up shop."

"We have just turned the column back over to the Communists with these decisions," charged Scherer.

Chairman Walter, vehemently denied that his subcommittee was in any way responsible for the suicide of a Monterey research scientist, William K. Sherwood, 41, who left a note saying he would be "assassinated by publicity" as a witness before the subcommittee.

However, Ernest Besig, executive secretary of the American Civil Liberties Union of northern California, called on the subcommittee to cancel its hearing "before they do further damage."

He charged the subcommittee with following a policy of harassing people and punishing them, rather than making a search for redemption for these people.

unity development projects. He also will meet with club officers in Saratoga, subject to approval of the state comptroller.

And asked Hallam for an opinion on the legality of a move to serve club in the western hemisphere, 20-30 International has local units in nine countries of the Americas. Its objectives are service to the community and the development of young business and professional leaders.

Foremost among its projects is the 20-30 Rumatic Fever Foundation, which annually contributes funds to the support of five medical research institutions of the United States.

Ike's Mind 'Open' On Civil Rights

WASHINGTON (AP)—Sen. Russell (D-Ga) said after a conference with President Eisenhower today that Eisenhower's "mind is not closed to amendments which would clarify" the administration's civil rights bill.

Russell, quartermaster backing, Southern forces opposed to the legislation in the Senate, told newsmen Eisenhower is against enactment of any "punitive" measure.

Eisenhower and Russell talked over the bill for about 50 minutes at the White House.

Although Russell said Eisenhower has an open mind with respect to amendments, he senses "where such amendments will be back to the President's mind is open."

The President's mind is open, Russell said. It is not closed to amendments which would clarify the administration's civil rights bill.

Audit Critical Of AG Office

SANTA FE (AP)—Operation of the state adjutant general's department has been criticized in a recent audit released by the state comptroller's office.

The audit mentions several points brought out in a two-day hearing which the Legislative Finance Committee held last week.

Russell said: "It is not closed to amendments which would clarify the administration's civil rights bill."

Water Pollution Problem Referred to Committee

Oilmen and city and state officials will meet in committee sessions in an effort to whip the long-standing threat of water contamination in the Hobbs area.

Five oil producers and two agencies yesterday were appointed to make a special study of the pollution problem, after a lengthy hearing called by the Oil Conservation Commission, OCC Secretary Director A. L. (Pete) Portman named Tex American, Samardan, Shell, Tidewater and Continental as industry representatives for the study, with the city water board and the state engineers office also to serve in the project.

Selection of the committee came after a morning tour and an afternoon discussion session had failed to turn up suggested solutions for the contamination of water wells by oil.

Two jobs at newspapers for their publicizing of the situation and a disagreement between representatives of two city agencies were other high spots of the hearing.

The meeting had been called at the request of the city commission. In a June 17 session, the commission heard reports of oil pollution in water wells north-west of Hobbs, and commission-ers at that time expressed apprehension that the oil might work its way into the \$2 million city system.

About 90 persons, representing the oil industry and city and state agencies, started the field trip that led off yesterday's hearing. The trip, designed to show delegates several possible sources of contamination, took up most of the morning.

But it was the afternoon session, moved to the high school little theater, that produced the brief flurries of criticism and conflict. A summary of the morning tour and of the overall pollution picture had just ended when Lloyd Calhoun, member of the city water board, took the floor.

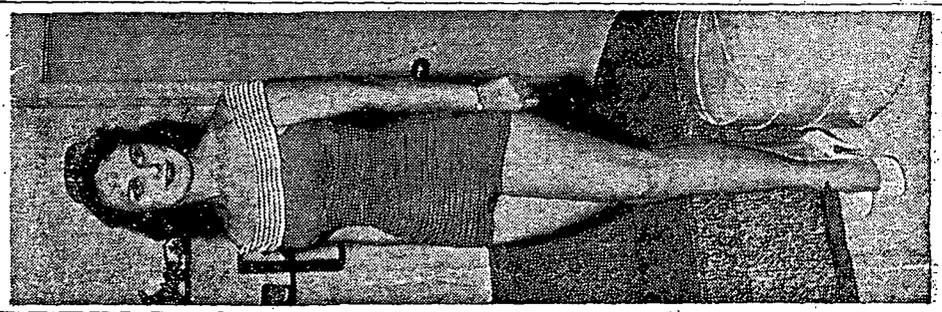

The nearest major city well is about two miles from an area of contamination, he said, adding that "we do not feel the Hobbs water system is in jeopardy — speaking of the Hobbs city system only."

He deplored the "premature publicity" given the problem by newspapers, then struck a spark by suggesting that the city withdraw from consideration of the problem and leave settlement of it to industry and state officials.

Asked later by Porter if Calhoun's statement changed the position of the city in the case, City Attorney Donald Hallam said "the city's position remains the same."

Porter also chided newspapers saying that "I have had an awful time with the newspaper reporters, convincing them that the city of Hobbs was simply being tampered on that. They seem to be hung on that."

"We feel we did take prompt action as did the operators in cutting off sources of pollution."

BEAUTY QUEEN candidate representing Hobbs in the contest for the most attractive Ground Observer Corps member in the El Paso Air Defense Filter Center is Miss Barbara Billingsley. She

Work to Begin On Four-Laner North of City

Preliminary work on a new 9.29-mile highway construction job to convert State Road 18 to a four-lane thoroughfare is scheduled to begin immediately. It was revealed today.

When completed the new four-lane highway will begin at the northern edge of Hobbs where Bender Blvd. now enters State Road 18, and continue northwest toward Lovington.

Officials of Miller, Smith & Jones, an Albuquerque road construction firm which was awarded the \$689,460 contract, yesterday said that the firm has set up an office approximately five miles north of Hobbs.

Said P. D. Miller, one of the partners: "We expect to begin about two months from now on the project within the next three weeks. We hope to hire much of our help locally."

Miller said that Fred Merritt has been named superintendent of the project for his firm.

The first phase in construction operations will be the setting up of a caliche crushing plant north of the city, Miller asserted. The next step will be erection of a blacktop hot mix plant.

Actual grading operations are expected to begin about July 18 near the middle of the project. Work will proceed from that point outward in two directions, Miller said.

R. D. (Bob) Bowling, project engineer for the New Mexico State Highway Department in connection with the job, has set up offices at 519 North

Touchy Rescue By Air

KING'S CANYON NATIONAL PARK, Calif. (AP)—The life of a critically injured mountaineer climber depends today on the ability of a helicopter pilot to land and take off on rugged 14,000-foot Pallasade Peak.

A furious Sierra thunderstorm last night—and the usual vagaries of the air currents at that altitude—passed formidable odds.

"It's his only chance," said Dr. Henry Jakes in a terse radio report describing the condition of 23-year-old John Findley Scott, University of California student who suffered internal and other injuries in a 40-foot fall Sunday.

He could never live through being packed out. He needs immediate hospitalization.

The doctor and park ranger James Barton arrived at the rugged base camp on Upper Pallasade Lake last night.

Scott was taken to the camp after his removal from a lofty ledge by six mountaineers Monday. The last portion of the trail to the camp was so steep the doctor and ranger had to leave their horses behind.

The vital question was: Could a helicopter land and take off at that treacherous, high altitude—even in good weather? Helicopter pilots said yes, if they were the right type of craft with a good pilot and went in lightly laden.

The Bell G2—in which pilot Bill Davidson hoped to make the attempt—was considered good enough to operate at the 14,000-foot area, although it is a critical altitude.

Davidson made several exploratory passes over the area

Victim Was Son Of Portales City Official

Traffic death claimed its 14th Lea County victim of the year today when a speeding car hurtled off the highway north of Tatum, overturned five times and threw the driver more than 40 feet away.

Eighteen-year-old John Lynn Miller of Portales died in a Hobbs hospital from injuries he suffered in the accident. He had been returning from a visit with his girl friend in Portales.

Investigators said Miller's 1948 Ford was traveling at an excessive speed and did not negotiate a curve, causing the 3 a.m. crash. The scene was 10 miles north of Tatum, on State Road 18, where the north-south highway bends to a northwest-southeast turn for a short distance. Deputy Sheriff P. Y. Tidwell and State Policeman O. D. Stanbro said Miller, driving alone, was going toward Tatum when he lost control of his car.

The vehicle went off the road-way for 285 feet, then angled back across the pavement for 232 feet more before it started to spin. The driver's body was thrown 42 feet from the point where the car stopped.

Portales sources said the youth had started home late from his visit in the Roosevelt County city, 110 miles from Hobbs. He was "very tired when he arrived (in Portales) and slept for two hours before leaving," they said.

Reached at the hospital here in Tatum by plane, he died about 15 minutes after being admitted, hospital officials reported.

Where the accident

Miller said that Fred Merritt has been named superintendent of the project for his firm.

The first phase in construction operations will be the setting up of a caliche crushing plant north of the city, Miller asserted. The next step will be erection of a blacktop hot mix plant.

Actual grading operations are expected to begin about July 18 near the middle of the project. Work will proceed from that point outward in two directions, Miller said.

R. D. (Bob) Bowling, project engineer for the New Mexico State Highway Department in connection with the job, has set up offices at 519 North

R. D. (Bob) Bowling, project engineer for the New Mexico State Highway Department in connection with the job, has set up offices at 519 North

Republican comptroller or Demo auditor has check-off authority, another contention between Demo and Republican officials on the state paying for cows and another on whether the Democratic legislature's workmen's compensation law by his veto surgery. When there is the situation at the highway office in which the Demo road commission refused to accept the Republican governor's nominee for membership, and in the capitol re the Demo Madam. Secretary has evicted the Republican from the tourist bureau's living room into a hallway. The Republican governor's nominees include such items as travel expenses to Demos, Socks Millers of the highway department and Sen. Dildo of the Legislature's finance committee, a Demo.

ITICAL LINES COMING VAGUE

There is political considerations involved in every issue but some points is kind of involved. The fight between the comptroller and the auditor was entered by a Democratic legislative committee, a long time before the last election which rising gave the state a Republican governor. The Demos committees decreed that the check-writing authority should be held by the appointive comptroller. The Demos also Gov. John Sims was challenged by Demo Atty. Gen. Fred Hildey in a joint statement Republican Gov. Ed McChesney. The workmen's comp measure litigation involved as Democrats as Republicans both sides of the issue. It involves an agency with the Demos than Republicans the tourist bureau disturbs the tourist bureau involves an agency with the Demos than Republicans such as the boss. Meanwhile the statehouse citizens are mingling with noizations of violence. The noizations, however, is hotter than any time since Republicans invaded the capitol in 1951. McChesney's first election in 1951 new, they were sterner. In time, 1957 go-round without ch. Maquordomo Fred Moxey Demos are fighting back.

Albert B. Sansom Taken by Death

Albert Barnett Sansom, 51, died tonight in a local hospital after a long illness. He had been hospitalized since last February. Mr. Sansom, a resident of 12 years, was taken by death at Griffin Funeral Home, 1000 S. Main St. Services are pending at Griffin Funeral Home, 1000 S. Main St.

such amendments. The President's mind is open, Russell said. "It is not closed to amendments which would clarify the bill." In advance of Russell's conference with Eisenhower there were hints at the Senate that sponsors of the administration measure probably will consider compromise.

The White House conference was set up with only a few minutes advance public notice. Proponents of the administration-backed civil rights measure started a drive Monday to bring the bill officially before the Senate. A week ago Russell denounced the measure as one which would take the South back to post-Civil War reconstruction days and open the way for forced racial integration of Dixie schools. He called the proposal "vicious" and a "cunning" plan to go far beyond the ostensible purpose of protecting Negroes' voting rights. That was in sharp contrast to Eisenhower's own description of the measure as "moderate."

Today, Russell pictured Eisenhower as still "very determined" to win enactment of civil rights legislation. But the senator declined under questioning to say whether the President indicated willingness to revise the administration bill. Russell expressed doubt that the bill—already approved by the House—will pass the Senate in its present form. Asked after his session with Eisenhower whether he felt better than he did before going to the White House, Russell smiled and replied: "I can't say that I do."

He added that he had requested the appointment with the President to discuss the bill with particular reference to some provisions that "I regard as very extreme." At a news conference a week ago Eisenhower repeated that he felt the bill was a moderate, decent one. But he also said there were some parts of the measure which he did not understand. He expressed some puzzlement over the view of opponents that direct results would flow from enactment of the bill. He expressed readiness to talk the matter over with Russell.

Emphasizing he would not quote the President directly, Russell reported today that he pointed out to Eisenhower certain provisions of the measure which Russell feels go far beyond the objectives set forth by the President at news conferences, and on other occasions. It was at that point that Russell said Eisenhower's mind is "not closed" to clarifying amendments. Asked whether he had suggested specific changes, Russell replied: "I did of course."

But he added to newsmen that he was not going to be drawn into setting forth those suggested changes at this time. Asked about the possibility of agreeing on a compromise, Russell said: "That would be such an (Continued on Page 5)

brought out in a two-day financing which the Legislative Finance Committee held last month into the operations of the adjutant general's office. The department is headed by Adjutant General C. C. Sage. "Irregularities were noted in expenditures from the 1955-56 audit. Personal long-distance calls claims for per diem allowances, general's official phone. A warrant (state check) issued for \$2,000 in payment of 800 issues of the National Guardsman endorsed by the National Guard Assn. of the United States Memorial Building Fund. A check for \$750 issued by the Santa Fe Army Board was similarly endorsed. "The question of the legality of these payments has been referred to the attorney general. Edward Hartman, state finance director, and the auditor comptroller, held up the audit report several weeks because the Finance Committee was probing the adjutant general's department. Hartman explained that the committee's probe might turn up information he would wish included in the audit.

Hobbsan Injured As Auto Upsets After a Blowout

Raymond Mitchell, 21-year-old Hobbs Negro, was injured this morning when a tire blew out on his 1936 Ford Thunderbird. Mitchell suffered the skull, rib and internal injuries in the accident, 16 miles west of Lovington on the Artesia highway. Deputy Sheriff L. S. (Lies) Villers said the resident of 1100 South Dal Paso "must have been driving at a high speed" at the time of the mishap. The sports car was terminated a total loss. The car "rolled two or more times," Villers said after the left rear tire blew it went a tenth of a mile straight down the spine and crossed the center line and sped 110 feet diagonally on the south side of the highway, left the blacktop and covered another 210 feet overturning. Villers and Deputy Sheriff Bill White investigated Mitchell, who works in Alamogordo, was brought to Lea General Hospital here in a Smith-Yarbro ambulance. Hospital officials this morning said the victim's condition could not be fully determined until further examinations were made. Time of the accident was set at about 7 a. m.

Reports \$257 Theft

Carl Edwin Moore, 507 West Taylor, today reported the theft of \$257 from his billfold which he had left locked in the glove compartment of his car. Moore told police the money was taken while his car was parked in the 800 block on East Byers.

action, as did the operators, in cutting off sources of contamination as rapidly as they were discovered," Porter continued. But he added of the hearing itself, "I did not hear any solutions" to the present contamination problem. "I hope to hear some solutions. Frankly I don't have Porter announced the decision to tackle the issue through committee work. "The commission has decided to appoint a committee to study means of preventing further contamination, beyond the methods now in use, and to explore any possibility of correcting the contamination we now have." He said the Hobbs OCC office will work with the committee, and asked that a progress report be submitted in 30 days. On the morning tour, the oil men and officials visited several sites and possible causes of contamination.

First stop was at the Dowell, Inc., where water used by Dowell appeared to contain gas. A lighted match over the water brought spurts of flame in a demonstration. City well No. 13 is about 2,000 feet from the site, and also near by is a dump ground where waste oil materials and acid have been placed. The OCC recommended on June 19, members of that body said later, that city well No. 13 be shut in, interest on the tour was centered at the O. H. Ellison farm northwest of Hobbs. There, evidence of oil in a water well was presented by OCC engineer Harry Engbrecht who said that one well on Ellison's property contained 12.8 feet of liquid including 6.3 feet of 34 gravity crude oil. Several other water wells drilled by Ellison contained varying amounts of oil, it was pointed out. Within a half-mile radius of the Ellison property, Engbrecht continued, there have been eight well repaired jobs, and within a two-mile radius, 38 wells have been repaired. An open waste oil pit heavy with oil, and a large area of water where gas bubbles have been noted, also were viewed. "The main reason for this tour is to show that there are other things causing contamination of the fresh water besides leaks in oil wells," OCC district engineer E. J. Fischer wrote in an explanation of the tour. "The degree to which they contaminate the fresh water is of course, impossible to determine."

The hearing was marked by cooperation and pledges of continued working together on the part of operators and agencies concerned. Representatives for the producing companies made reports of past efforts to control contamination and said their firms will do anything possible in the future to prevent damage.

Tomorrow — St. Louis at New York (N), 1 p. m.; alternate, Boston at Detroit (A), 1 p. m.

Miss Barbara Billingsley, Mrs. J. T. Billingsley, 1602 Jefferson. GOC Member To Seek Title

A 16-year-old member of the Hobbs Ground Observer Corps post will represent this city as a candidate for GOC Queen to be chosen in the El Paso Air Defense Filter Center. The Hobbs nominee is Miss Barbara Billingsley, daughter of Mr. and Mrs. J. T. Billingsley, 1602 Jefferson. An attractive Hobbs High School student who will be a junior this fall, Miss Billingsley has light brown hair and blue eyes. She will be flown to El Paso Saturday to compete in the beauty contest against other candidates in the El Paso Filter Center area from New Mexico communities of Lovington and Empire, and Seminole, Odessa, Crane, Kermit, Wink, Valentine and El Paso in Texas. The winner of the contest will be crowned queen at a coronation ball in the Hilton Hotel in El Paso Saturday night. She will receive a trophy and an extensive wardrobe as rewards. The project of sponsoring Miss Billingsley in the local GOC activity of the contest is by post and the Hobbs Chamber of Commerce.

Miss Billingsley has been a member of the Hobbs GOC post since last January. She recently completed her 500th hour as an aircraft observer. One of her biggest thrills while on duty in the GOC tower, she said, came one day when she spotted a large twin-engine Air Force helicopter, known as "a flying banana," zooming over the city. Although Miss Billingsley has a summer time job as cashier in the Frontier Theater ticket office, she still finds time to continue her duties as a GOC observer.

Lottery Winner Dies Due to Excitement

MELBOURNE, Australia (AP) — John Archer, the Salvation Army color sergeant who lost his job because he won a \$30,000 lottery prize, died Monday. Archer, 73, and a pensioner, was suspended for three months for gambling after he won the top lottery prize. Later he suffered a stroke and died. He declined steadily. A spokesman for the Salvation Army said the shock and excitement of the win was too much for the old man.

Flash Floods Hit in Kansas

TOPEKA, Kan. (AP)—Flash floods hit the Topeka area early today driving scores of persons from their homes, including Mrs. Georgia Neese Clark Gray, former treasurer of the United States, and her husband Andrew. An elderly couple reported missing in the early stages of the flood was found safe with friends. The flood came just two days before the anniversary of the one which caused a billion dollars in damage in Kansas and Missouri in 1951.

Hardest hit, apparently, was Richland, Kan., 18 miles south of Topeka, home town of the Grays, after rains which unofficially were reported to have ranged to more than seven inches in places. Gray reported that most of the town's 250 residents had been evacuated from their homes and had taken refuge in the bank and store operated by the Grays. A 100 of water from Wakarusa River was swirling down the main street, and parts of the town drinking water and electricity were unavailable. Water stood five inches deep in the Gray home. At Abilene, 80 miles west of Topeka, a cloudburst dumped an estimated 10 inches of rain on a single farm and sent water rushing across U. S. 40 so suddenly that it swept five passing cars into a ditch. None of the occupants, all military personnel en route to their homes in Abilene, to duty at nearby Ft. Riley, was injured. Patrolman Tom Nold said the cloudburst fell only on about three acres of the Ivan Kelly farm, because of the Ivan Kelly farm, between Abilene and Chapman, 12 miles east. In Topeka dozens of homes were flooded. Police call for boats to use in rescue operations.

VFW Meets Friday

Veterans of Foreign Wars, Blakely Post No. 3274, will meet at 8 a. m. Friday, according to Jerry Millican, post adjutant. APPLICATIONS DENIED. SANTA FE (AP)—Applications for six small loan licenses have been denied by F. F. Wadsworth, state bank examiner. They include: Albert Moxey, which has four licenses; Roswell Otto, 71, 96; Tucumcari, 62, 95; Santa Fe, 68, 95; and Pecos Valley Finance Co., 51, 82. Highest wind speed (SE) 23 mph at 4:30 p. m.

could not be determined immediately. Portales officials said only that he was employed by an oil company "working out of Hobbs." He was the son of Mrs. Florence Miller, Portales city clerk. The body was taken to Griffin Funeral Home here after the completion of funeral arrangements in Portales.

Two Plead Innocent Following Affray in Hobbs Restaurant

William DeWitt Shelton, 31, of 409 Rainbow Drive, yesterday pleaded innocent to a charge of carrying a deadly weapon at a restaurant in city court before Judge Robert L. Bensing. The charge was filed in connection with an alleged shooting in an all-night cafe early yesterday. One was struck by the flying pellets. Mrs. Patsy Nell Shelton, 27, wife of Shelton, also entered an innocent plea to a charge of assault in connection with an alleged ice pick stabbing incident that occurred at about the same time of the shooting. Trials for the pair were set for tomorrow morning at 10 o'clock. Each was released upon posting \$100 bond.

Sid McDonald Hudson, 29, of Lapas, Tex., with whom witnesses said Shelton had been engaged in a fight earlier and who was in the cafe at the time of the shots, was charged with affray. He did not show up for arraignment and forfeited a \$25 bond. Another person involved in an incident, Lee Jackson of 300 East Broadway, victim of the ice pick stabbing, was arrested yesterday at 2:30 p. m. and released on \$50 bond pending arraignment.

Stephens Infant Dies in Hospital

Graveside rites were set for 3 p. m. today for Sandra Beth Stephens, infant daughter of Mr. and Mrs. Loyd Stephens of 904 North Burk. The child died last night in a local hospital. Services were planned at Prairie Haven Cemetery with the Rev. Orval See, pastor of the Immanuel Baptist Church, officiating. Griffin Funeral Home was in charge of arrangements. The girl's father is a pumpner here for Gulf Oil Corp. Survivors besides the parents include one brother, David, 7, and three grandsons, Mr. and Mrs. J. F. Stephens of H. Minny, Okla., and Mrs. Florence Butler of Cleveland, Okla.

day passed over the area yesterday and dropped supplies and medicine. He reported it would be difficult to find a "safe" place to land. If the helicopter can't land, Dr. James said, there would be no alternative except to start out with Scott on a stretcher. That trip would take four days.

Weather. Clear to partly cloudy today, tonight and Thursday. Scattered afternoon and evening showers and thunderstorms. Today 80-95 north and 90-105 south through Thursday. Occasional afternoon or evening thundershowers. Little temperature change. High yesterday 94, low tonight 68. Today 11-30 a. m. 88 12-30 a. m. 74 1-30 p. m. 93 2-30 p. m. 71 3-30 p. m. 81 4-30 a. m. 68 5-30 p. m. 86 6-30 a. m. 69 7-30 p. m. 82 8-30 a. m. 77 9-30 p. m. 79 10-30 a. m. 84 No precipitation. High 94 at 3:30 p. m.; Low 67 at 4:30 a. m. Minimum and maximum temperatures for towns in New Mexico and Texas: Farmington 62 93; Carlsbad 65 95; Roswell 71 96; Tucumcari 68 95; Santa Fe 68 95; Las Vegas 51 82; Albuquerque 74 89; Highest wind speed (SE) 23 mph at 4:30 p. m.

May 31, 1957

A Bradenhead survey by the Oil & Gas Commission in 1956, showed pressure between the 5-1/2" & 8-5/8" casing in well #6.

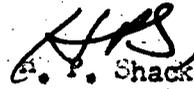

Well was worked on the first part of September, 1956. There were no holes in 5-1/2" csg, as we were unable to break circulation between 8-5/8" and 5-1/2" csg. The pressure was probably caused by Yates gas.

The reason they are checking the water bearing formation (37' horizon) around this well is because they think we repaired a leak in the surface casing, and if they can show the water bearing formations are contaminated, that this well was the one that did the damage. They found some oil in most of the water wells drilled.

There is more behind this than just the particular surface owner mentioned in my letter of May 27th. I believe some rather influential people are backing this person. They are contemplating, I believe, a suit and the reason for the suit is that a rancher in the Slaughter pool in Texas sued Gulf Oil Company in a similar case, and won.

They tell me the shallow water formations in this area have been contaminated for 15 plus years. I do not know of a thing we can do about this matter.

I think it is an explosive situation and they will eventually sus. It could be an expensive thing.

Mr. C. D. Callamore - Tulsa

Mr. J. O. Walton, attorney, representing a Mr. Ellison, called me Friday, May 24, 1957 at approximately 5:00 PM. He told me that Mr. Ellison, his client, who owns the surface rights surrounding the No. 6 well on the McKinley lease, was drilling some water wells surrounding this oil well and wondered if we would like to check the water in the drilled wells. When he called, two wells had been drilled to a depth of approximately 37'. The well about 150' north of #6 had good water and the well drilled approximately 150' south of #6 had some oil with the water.

After talking to you, I checked with Mr. C. M. Neal, attorney representing the company. He advised us to stay away, which we did.

Attached is copy of a letter I received from Mr. Neal.

Hobbs, New Mexico.

Attention: Mr. H. P. Shackelford.

Gentlemen:

It is my understanding from you that Mr. J. O. Walton, an attorney of this city who represents Mr. Ellison, advised you that Mr. Ellison had drilled some water wells in the vicinity of your McKinley No. 6, and had found contaminated water. He advised you that they intended to make some tests and that if Tidewater desired to have a representative present at the taking of these tests this morning, they were free to do so.

As I advised you over the telephone, it is my opinion that we should not attend the making of these tests. We must assume the position we have in the past that the contamination, if any, which exists in the area is not the responsibility of Tidewater.

Very truly yours,

C. M. NEAL

March 4, 1957

Mr. R. H. Coe on his recent trip to Hobbs, advised that the company was ready to turn loose the 180' x 200' tract west of tank battery on subject lease. He also, advised that I send in the name of the person who purchased the land surrounding the battery.

Mr. Gail Boman, Star Route "B", Hobbs, New Mexico, purchased the land and is the person desiring the water well located on the 180' x 200' tract. Mr. Boman agreed to sign an agreement whereby the company would not be liable for any future condition of the water.

I think the company should also state, in the agreement, that the tract, if desired for house or if needed in future operations of this lease, that owner would return same.

Mr. C. D. Callamore - Tulsa

February 20, 1957

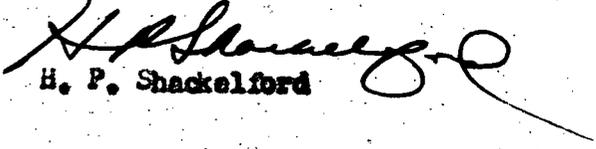

All wells and the tank battery on Getty Oil Company's - H. D. McKinley lease have been fenced.

There is an area west of the tank battery that was not fenced with the 6' cyclone fence. This area was previously fenced with three strand barbed wire.

The area is 180' x 200'. There are five old water wells and two old tanks that are junk, located in this space. We do not need the space for our operations. The person who is sub-dividing the area wants to put a road across the space. The person who purchased the surrounding land would like to have the water well. (The other four wells should be plugged.) He will sign an agreement relieving us of any future responsibility.

I recommend we abandon this area and turn the water well over to the person who purchased the land.

Please advise.

MISCELLANEOUS REPORTS ON WELLS

Submit this report in TRIPLICATE to the District Office, Oil Conservation Commission, within 10 days after the work specified is completed. It should be signed and filed as a report on Beginning Drilling Operations, Results of test of casing shut-off, result of plugging of well, result of well repair, and other important operations, even though the work was witnessed by an agent of the Commission. See additional instructions in the Rules and Regulations of the Commission.

Indicate Nature of Report by Checking Below:

Casing Leak Survey
McKinley Lease
Hobbs Pool

Mr. R. H. Coe - Midland

Production Hobbs

Mr. H. E. Wendt - Midland

August 7, 1956

Mr. H. B. Berg - Tulsa

Mr. A. H. Mouser - Tulsa

Due to complaints of several land owners in the area of the McKinley Lease regarding the contamination of fresh water wells, the Oil Conservation Commission scheduled a casing leak survey for all wells within a one-half mile radius of the McKinley lease. Casing pressures on the McKinley lease were checked by Mr. Rieder, OOC Engineer, on August 6th. The pressures were bled off and read again on August 7th after 24 hours shut-in.

The McKinley #1 and #3 had no pressures on any outlet and were considered safe from causing contamination.

The McKinley #2 recorded no pressures between the 5" and 7" or 12 1/2" and 9 5/8", but had 200 psi between the 9 5/8" and 7". This pressure bled to a very slight continuous blow of gas. After a shut-in of 24 hours the pressure was again 200 psi. Skelly repaired a casing leak on this well in 1954 and supposedly circulated cement to the surface between the 9 5/8" and 7" casings. Evidently there is a channel of gas from the Yates formation. Mr. Rieder was not concerned for this well and does not feel it is causing contamination since there is no pressure build up between surface and intermediate.

From the Commission's last survey it was evident that there was a casing leak in McKinley #4. I told Mr. Rieder that we had authorization to repair this leak and work would commence in the very near future. He insisted that we take immediate action.

McKinley Wells #6 and #7, Bowers sand producers, have 8 5/8" casing set at approximately 1500' and 5 1/2" casing set at approximately 3180'. The volume of cement used on the 5 1/2" casing strings was not sufficient to tie in the 8 5/8" strings. These wells recorded pressures between the 5 1/2" and 8 5/8" casings of 440 psi and 600 psi respectively. Both wells flowed salt water and sweet gas for approximately 10 minutes without weakening. The 24 hour build up pressures were 440 psi and 560 psi respectively. Mr. Rieder does not know at this time how these wells should be treated. In their present state they are not likely to be causing contamination, but if a leak occurred in the 8 5/8" casing, Mr. Rieder feels that damage could occur immediately. He feels that after the survey is complete the operators and Commission should have a meeting to discuss what, if any, action should be taken for these wells.

The McKinley #5 had no pressure between the 12 1/2" and 9 5/8" casings but had 80 psi between the 9 5/8" and 6 5/8" casings. In bleeding off there was a strong blow for four minutes and then a fair steady blow for ten minutes. The gas was definitely sweet and there is little doubt that its origin is the Yates or Seven-Rivers. Since there is surface casing and no build up between it and the 9 5/8" casing there does not appear to be any danger of contamination from this well. The build up between the 9 5/8" and 7" casings after a 24 hour shut-in was 20 psi. The well was bled again and after five minutes had a very slight blow of sweet gas.

August 3, 1956

Mr. H. P. Shackelford,
Tidewater Oil Company,
Hobbs, New Mexico.

Dear Sir:

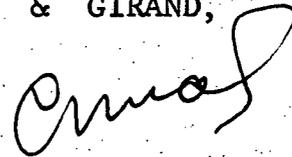

We have given some consideration to the problem of underground water contamination in the area of the Getty lease about which we had a conversation a few days ago.

It is our opinion at this time that the company should sit tight and take no steps one way or the other in connection with this matter. I am advised that the Conservation Commission is going to make a braden head test of the adjoining wells and unless there is some sub-surface leaking from these wells, there would appear to be no corrective measures to be taken at this time.

Very truly yours,

NEAL & GIRAND,

DATE: July 26, 1956

Please find attached a copy of a letter from Mr. Page regarding the situation on the subject lease with respect to rights of surface owners. Undoubtedly we will be faced with many problems as additional houses are built on this lease and, as Mr. Page suggests, we should keep very close check on the location of any future buildings as related to oil and gas lines.

As you have previously been informed, we have made arrangements with the law firm of Neal & Girard at Hobbs to represent us locally. If Mr. Shackelford has any problems that need "on the ground" attention, he is free to call this firm. We, of course, should be kept advised of any new developments.

I would suggest that a request for AFE be submitted covering the fencing of our wells and tank battery which we will pass on to the Getty Oil Company for their consideration.

Re: GETTY OIL COMPANY McKINLEY LEASE
LEA COUNTY, NEW MEXICO

I have reviewed Mr. Shackelford's letter of July 17. The pollution claim of Mertaugh, now based on salt water pollution, is a fact question. If the pollution complained of occurred prior to the acquisition of title by Mertaugh, we could probably defend Mertaugh's claim, unless he took an assignment of the right of action of the prior owner. However, since Getty is apparently disposing of salt water in open pits Mertaugh could probably establish that additional pollution has occurred since he acquired title. I do not believe the claim can be defended on the failure of the surface owner to case his well.

The map shows that the two water wells adjacent to the tank battery are abandoned water wells. If these wells were abandoned by Getty they would revert to the surface owner, and consequently the surface owner would be entitled to dispose of the wells. I do not suggest that we should settle this claim for pollution, but I do believe that the oil companies have enjoyed freedom from claims in the past due principally to the worthless character of the surface, which is now becoming valuable for subdivision purposes. Operators can expect to be required to meet a higher standard of operation than was formerly necessary. I do not believe that the operators can establish prescriptive rights to pollute the surface or water reservoirs. On the facts, salt water from McKinley #5 well may not have been the basis of the pollution complained of. That will depend upon what kind of a case can be established by the claimant and what evidence Getty can obtain to rebut it.

As the lessee Getty has the right to use as much of the surface as is reasonably necessary for oil and gas exploration and development, but that right does not mean that Getty has the right to use earthen pits for salt water disposal if the result is pollution of fresh water reservoirs.

I concur with Mr. Shackelford's recommendation to fence well locations and tank battery locations with 6' of Cyclone

Mr. H. E. Berg - #2

fencing and two strands of barbed wire on top. Getty does not own the surface rights and cannot prevent the surface from being subdivided and used for home sites. The fact that this results in increased diligence on Getty's part to prevent damage or injury to surface occupants would not justify Getty's failure to conduct its lease operations in a prudent manner. Generally speaking, the lessee is not required to fence locations to prevent injury to livestock. However, pump jacks and tanks have been considered an attractive nuisance and can result in claims for personal injury to children. Here again, what measures Getty is required to take depends upon the facts of the particular case. From Mr. Shackelford's statement, it would not appear to me that the present fences would be considered adequate.

The surface owners have the right to construct new roads and make such use of the surface as they wish, so long as the oil and gas lessee is afforded the right to use as much of the surface as is reasonably necessary for the purposes of his lease. This does not mean the right to the use of the surface exclusively, nor to prevent inconvenience resulting from the surface owner's use. Getty cannot be denied the right to ingress and egress to the wells and battery, but it does not necessarily mean that Getty can require the maintenance of particular lease roads if reasonable access is provided.

From the map furnished, it does not appear that any improvements are constructed over oil or gas lines on this lease, and therefore there is no action to be taken on Getty's part at this time. However, the lease superintendent should retain a copy of this map and note all future surface locations which may be made over oil or gas lines, and promptly notify the surface owner not to construct any improvements over oil or gas lines. If in any case a surface owner proceeds contrary to such notice, the matter should be referred to us for further action.

Water Well - McKinley Lease

Mr. H.E. Berg - Tulsa

Producing

Hobbs

Mr. R. H. Coe

July 17, 1956

In my letter of July 12, 1956 I stated that Mr. Mertaugh told me that his water well was being damaged due to the intrusion of gas. The letter written by his attorney claims the water well is damaged due to salt water seepage from Getty Oil Company's - McKinley Well #5.

At the present time, the State Water Board has asked the Oil Conservation Commission to request all oil companies to start making plans for the disposal of salt water by injecting same in a formation below all known fresh water sands and to eliminate the use of open pits. Because the contamination of water wells by salt water intrusion will probably be grounds for a lot of law suits in the future, I think the attorney changed from gas to water.

A few years back one major company had a well in this area that flowed about 40 BOPH out the Bradenhead. Several water wells were contaminated with gas at that time. The casing on the well was repaired and no permanent damage was done to the adjacent water wells.

Most of the water wells on the Getty Oil Company's - McKinley lease, and there are several of them, were drilled to one or two of the top water sands (60' to 80' Deep). About 10' of casing were set in these wells. With this amount of casing in the well, I can see how they could be contaminated by any surface pits. In this case, I do not believe water well is contaminated with salt water from the No. 5 well on the McKinley lease nor the salt water pit, however, I cannot prove that it isn't.

I understand some acreage was sold adjacent to the tank battery location where Getty Oil Company has two water wells, with the understanding that one or both of the water wells went with the acreage.

I talked to Mr. Coe about getting samples from the water wells. He thought an attorney should be consulted and advise us whether or not we should get the samples.

I talked to Mr. Dunlavey, with Skelly, and he said that they had similiar troubles but never paid any damages. I think several people threatened to sue Skelly and he invited them to sue, but none of them accepted. Skelly has two of the best lawyers in Hobbs to handle their complaints.

I do not think the company should assume any liability in this matter. After talking to Mr. Dunlavey, it seems that most of the upper fresh water sands are known to be contaminated in this area. If the company paid for one water well, they would eventually have to settle with all water well owners in the immediate area.

The seven wells on this lease are fenced. Most of the well fences are 160' by 200'. Where a separator is at the well, the fenced area may be as much as 160' x 275'. The fence consists of three strands of barb wire. In the near future, all well locations and tank battery location should be fenced with 6' of Cyclone fencing, with 2 strands of barb wire on top. The cost of fencing the wells and tank battery location will be approximately \$13,000. This seems rather high, but it might be cheap if it prevented a child from being hurt.

They are cutting new roads, making passage over the old lease roads difficult to the wells and battery.

I think this is a serious matter and that an attorney should investigate and advise us as to our rights.

COPIES: Mr. R. H. Coe DATE: July 13, 1956

This has reference to your memorandum of July 12, 1956, regarding the damage claim of Mr. Mertaugh's water well on the Getty Oil Company-McKinley lease. It is impossible for us to make any decision in this matter with what information we have available.

In your letter of June 25, to which you referred, the claim appeared to be that the well was being damaged due to the intrusion of gas. The present claim is for salt water seepage. Please advise whether or not you feel this seepage of salt water is caused from any of our producing wells or by possible seepage of surface salt water pits. If you feel, as indicated in your letter of June 25, that we are not at fault in this matter, we will, of course, deny all liability. However, if there is any possibility that the damage has been caused by our operations, we would, of course, like to make a settlement out of court.

Water Well

Mr. R. H. Coe
Mr. H.E. Berg
Mr. C. D. Gallamore

Producing Hobbs
June 25, 1956

Mr. Jack Mertaugh, Hobbs, New Mexico, recently purchased a small tract of land on Getty Oil Company's - McKinley Lease. This tract of land has a water well, approximately 75' deep, with about 10' of 7" casing in the top, the remaining 65' being uncased. He states that the water produced from the well contains gas. He also said the well was about 2 years old and had always been that way.

He said that he talked to the District Attorney and he advised him to see the Oil Company. I know Mr. Mertaugh and he came by the house last week and talked to me about the well. I told him that the well was in bad shape when he bought the place, which he admitted. The hole was not cased and it has always been a bad well. I also told him that we had tested the surface casing on all the wells and the Commission had approved these tests. I also told him that we could not do anything for him because if we did, then we would be admitting that we were at fault, which we are not.

It seems that the shallow water sands in this area are gassy, however, the main water sand, around 100', is not gassy.

I thought this information should be passed on to you.

File

July 11, 1956

Tidewater Oil Company
Hobbs, New Mexico

Gentlemen:

I represent Mr. Jack E. Mergaugh, who owns a small tract of land in the East Half of the Northeast Quarter of Section 30, Township 18 South, Range 38 East.

Mr. Mergaugh has a water well on his tract which has been ruined by a salt water seepage. Your company operates an oil well known as the H. D. McKinley Well No. 5, located approximately 300' East of my client's water well. It is our contention that salt water from this oil well is polluting the water sand.

We believe that for a nominal cost the water well could be cleaned out and cased and the salt water shut out of it.

Please advise whether or not your company is willing to take care of this matter without necessity of a lawsuit.

Very truly yours,

Kermit Nash

SUBJECT: Pacific Western - McKinley Lease

Your File No. _____

TO: Mr. H. P. Shackelford - Hobbs

FROM: Production - Tulsa
(Dep't.) (Location)

COPIES: Mr. R. H. Coe

DATE: January 24, 1956

From your memorandum of January 14, 1956, regarding the Pacific Western's McKinley No. 4, you apparently feel that some remedial work to repair the casing leak should be done in the not too distant future. I would suggest that you prepare an AFE to cover the job and we will pass it on to Pacific Western for their approval. It might be that they will want to wait but if the job has to be done it would seem we might as well get it over with before the condition gets any worse.

Since No. 7 is a Bowers sand well, I am wondering if you could anticipate sufficient production from the well to warrant a work-over job. If you can find from past history that the well is a fairly good producer and you feel the rework is justified, please submit a blue sheet and we will also pass it on to Pacific Western.

H. E. Berg

HEB:hm

Pacific Western Wells #4 & 7,
McKinley Lease

Mr. H.E. Berg - Tulsa

Production - Hobbs

Mr. R.H. Coe - Midland

January 14, 1956

The Pacific Western's, McKinley Well #4 was recently checked. Pressure between 12 $\frac{1}{2}$ " and 9-5/8" casing was 110#. Pressure between 9-5/8" casing and 7" casing was 690#. Casing pressure on the 7" casing was 690#. This indicated a definite leak in the 7" casing. I would say there is no leak in the 9-5/8" casing at the present time. I do not believe immediate remedial work is necessary, however, this condition should not be allowed to exist too long.

This well has a cellar approximately 18' deep. The cellar walls are in very poor condition, and should be repaired immediately. The cost of repairing the cellar would be around \$600.00.

Well No. 7 has stuck tubing. It is a Bowers well and is producing no oil at the present time. The tubing string has a joint of tubing, bull plugged, below the perforations. We believe sand has accumulated around the anchor and stuck the tubing. This condition should be remedied.

SKELLY OIL COMPANY
Box 38, Hobbs, New Mexico

December 8, 1955

Re: PW-McKinley Lease No. PW-458
Well No. 4

Mr. J. S. Freeman
Skelly Oil Company
Tulsa, Oklahoma

Dear Sir:

The above well was completed in August, 1930, at a TD of 4219' for an IP of 14,061 BOPD based on a one hour test of 595 bbls. oil flowing. The well is producing from the San Andres formation of the Hobbs Pool and is presently flowing top allowable of 40 bbls. oil and 5 bbls. water per day.

This well has been flowing for 25 years in a highly corrosive area in which several wells have recently reported casing leaks. Indications are now present that this well has now developed casing leaks. There is sour gas present between the 7" and 9 5/8" casing strings which indicates a leak in the 7" string. Between the 9 5/8" and the 12 1/2" surface casing, there can be detected sweet gas which would indicate possible leaks in the 9 5/8" string. There are also indications that water is coming up outside the 12 1/2" surface casing. Since this well is in an area which is being closely watched by the New Mexico Oil Conservation Commission for casing leaks and possible fresh water pollution, it is recommended that the well be repaired and brought up to Commission standards.

It is, therefore, recommended that the following work be done on this well:

1. Locate 7" casing leaks and repair by circulating cement behind the 7" casing.
2. Run a Spinner survey to locate the point of water entry.
3. Run a string of 5" OD casing to TD and circulate cement to the surface.
4. Run a Gamma Ray-Neutron log to TD.
5. Perforate and squeeze the water zone.
6. Perforate and treat the oil zones for production.

This type of recompletion has proven very successful on the PW-McKinley No. 1 and No. 2, in which similar situations were encountered. We expect this well to flow for many years and this job will not only bring the well up to Commission standards but will also put the well in a condition to operate safely over the rest of its expected producing life.

Yours very truly,

/s/ J. N. Dunlavey

DETAILS OF WORK

State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work

The purpose of this workover was to locate and eliminate the fluid flow into the cellar,

On August 2, 1953, temperature survey and delta log were run by the Worth Well Co. with temperature anomalies found at 12', 215', and 3676'. Halliburton pump truck rigged up and pressured up between tubing and 5-1/2 casing and between 5-1/2 and 7 inch casing with no signs of leaks. A pressure of 1300 psi between 7 and 9-5/8 inch casing blew the packing from the bradenhead between 7 and 9-5/8 inch casing. The cellar was dug to approximately 12 feet and fluid was found entering through an open 1/2 inch valve on the surface casing. The well was flowed to pits at the rate of 13 to 20 barrels per hour. A total of 2468 barrels of water was pumped through the casing into the formation with no increase in flow from surface casing and no water in the fluid coming from the surface casing.

(Continued)

Understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.

Details of Work (Continued)

B. A. Ewers - Federal 4/8 1

A. P. (Bak) Siberian workover rig was rigged up on August 6, 1953. After pulling the 2-inch tubing a 4-1/4 inch bit was run on the tubing, a Baker production packer was run from 3750 to 4010 feet, and the packer was drilled. A Baker GI retainer was run on P. O. A. wire line, set at 4000 feet, and casing perforated at 3776 feet with 4 jet shots. With a Baker P & T tool set on the tubing at 3815 feet, the perforations at 3776 feet were pumped into, initial pressure of 3000 pounds broke to 2100 pounds at rate of 1/4 barrel minute, with no effect on flow from surface casing. Worth Well Company Temperature Survey, Delta Log, and Potential Survey were run. Delta Log indicated gas movement at 3875 feet. A Baker bridging plug was set at 3795 feet, 5-1/2 inch casing perforated 3677-3678 feet with 4 Walax jet shots per foot, Baker P & T tool set on 2 inch tubing at 3610 feet, and 900 barrels of water was injected into the formation with no effect on production from surface casing. The perforations 3677-3678 feet were cements cemented in three stages of 50, 100 and 100 sacks; 70 sacks of the last 100 were circulated out. The perforations at 3976 feet were squeezed with 40 sacks of cement, 37 sacks of which were reversed out. A Baker Model "B" production packer was set at 4100 feet on wire line and 4158 feet of 2 inch tubing was set at 4198 feet. One hour waiting kicked the well off and the rig was released.

The flow gradually declined from day to day and on September 8, 1953 the amount produced from the surface casing was 29.71 barrels oil.

Total cumulative oil produced through surface casing through September 8, 1953 is 342.58 barrels oil.

Secretary & Director

Gentlemen:

On August 2, 1953, we discovered a leak in the cellar of Federal-Bowers "A" No. 2 located on our Federal Bowers lease in the Hobbs Field, Lea County, New Mexico. Flow into the cellar was estimated at one barrel per hour. The cellar was dug out and the annulus between 12-1/2-inch and 9-5/8-inch casing was found to be flowing oil through a 1/2-inch valve on the 12-1/2-inch bradenhead. Flow was estimated at 2.5 barrels per hour.

Federal Bowers A-2 was originally completed in September, 1930, in open hole from the 7-inch casing set at 3960 feet to 4213 feet. The well was re-entered in September, 1947, and holes were located in the 7-inch oil string at 490 and 375 feet. These holes were repaired by perforating the 7-inch oil string at 1500 feet and circulating cement to the surface between the 7-inch and 9-5/8-inch casing. The hole was deepened to 4238 feet and a string of 5-1/2-inch casing was run inside the 7-inch casing set on bottom and cemented with 30 sacks. The 5-1/2-inch casing was perforated from 4010 to 4205 feet. A Baker production packer was set at 3940 feet and the well returned to production. A well completion diagram is attached.

After the cellar was cleaned out, the 5-1/2-inch oil string was tested with 1000 pounds pressure and found to hold pressure satisfactorily. A similar test was also made on the annulus between the 5-1/2-inch and 7-inch casing. This annular space was tested with 1000 pounds and was found to hold pressure satisfactorily.

COP

HUMBLE OIL & REFINING COMPANY

HOUSTON 1, TEXAS

- 2 -

On August 5, 1953, a total of 1685 barrels of water was pumped into the producing interval from 4010 to 4205 feet. Injection pressures ranged from 900 to 1600 pounds. The flow on the 1/2-inch valve on the 12-1/2-inch bradenhead had increased to 15.5 barrels of oil per hour. On August 6 after pumping an additional 455 barrels of water into the producing interval, the Baker production packer at 3940 feet was drilled out and a retainer set at 4000 feet. The 5-1/2-inch oil string was perforated at 3976 feet with four shots and a Baker P & T tool was set at 3916 feet. A total of 300 barrels of water was pumped through the perforations at 3976 feet in ten hours. The average injection pressure was 2100 pounds. A temperature survey, Delta log and potential survey were run. A bridge plug was set at 3795 feet and the 5-1/2-inch casing perforated from 3677 to 3678 feet with four shots. A total of 900 barrels of water was injected through perforations from 3677 to 3678 feet. Injection rates ranged from 16 to 60 barrels per hour and injection pressures from 2700 to 3800 pounds. As of August 8, 1953, the oil flow on the bradenhead had increased to 13.5 barrels per hour.

The results of these tests indicate that the oil flow on the 12-1/2-inch bradenhead of Humble Federal Bowers A-2 is not the direct result of a casing leak in Bowers A-2. Humble is now in the process of conducting temperature surveys in its other wells in the area in an effort to locate any possible casing leaks which might serve as a source for the oil flow noted in the bradenhead at Federal Bowers A-2. The characteristics of the oil being produced from the 12-1/2-inch bradenhead at Bowers A-2 indicate that the San Andres is the source of this oil. Humble has contacted offset operators and advised them of the situation at Bowers A-2.

We request that we be issued such tenders as are necessary, covering the oil produced from the bradenhead on this well during the period that it continues to flow; in the meanwhile, Humble will continue diligently its efforts to locate and control the source of the oil now being produced from the 12-1/2-inch bradenhead of the Federal Bowers A-2 well.

Yours very truly,

HUMBLE OIL & REFINING COMPANY

MEMORANDUM

TO: New Mexico Oil Conservation Commission
Attention: Mr. A. L. Porter, Jr., Secretary-Director

FROM: Committee Studying Protection of
Hobbs Fresh Water Sands

SUBJECT: Final Report of the Committee

Transmitted herewith is the completed final report of the Committee. This report contains no direct recommendations since it is the consensus of the Committee that the need for any corrective action is adequately shown in the Committee findings. In some instances this corrective action is outside of the jurisdiction of the Oil Conservation Commission. We trust that you will arrange to have these matters brought to the attention of the appropriate persons or agencies.

It was the decision of the Committee that attendance at its meetings should be restricted to representatives of the agencies and companies appointed to the Committee, and to guest speakers specifically invited to a particular meeting. Mr. E. G. Minton, Lea County Hydrologist, was the only such speaker. The need for closed meetings was indicated by the somewhat negative results observed at the general meeting held in Hobbs on July 9, 1957.

The official representatives designated by each of the agencies and companies appointed to the Committee are listed as follows:

Pan American Petroleum Corporation
C. L. Kelley, Chairman, Roswell, New Mexico
J. W. Brown, Alternate, Roswell, New Mexico

Continental Oil Company
R. L. Adams, Member, Roswell, New Mexico
F. T. Elliot, Alternate, Hobbs, New Mexico

Hobbs City Water Board
L. A. Calhoun, Member, Hobbs, New Mexico
W. G. Abbot, Alternate, Hobbs, New Mexico

New Mexico Oil Conservation Commission
R. F. Montgomery, Member, Hobbs, New Mexico
E. J. Fischer, Alternate, Hobbs, New Mexico

Samedan Oil Corporation
C. W. Putman, Member, Hobbs, New Mexico
C. E. Layhe, Alternate, Hobbs, New Mexico

Shell Oil Company

W. E. Owen, Member, Hobbs, New Mexico
R. C. Cabaniss, Alternate, Hobbs, New Mexico

State Engineer's Office

Zane Spiegel, Member, Santa Fe, New Mexico
R. L. Borton, Alternate, Roswell, New Mexico

Tidewater Oil Company

H. P. Shackelford, Member, Hobbs, New Mexico
R. N. Miller, Alternate, Hobbs, New Mexico

Other representatives of the agencies and companies appointed to the Committee attended meetings as second alternates, served as members of subcommittees, or otherwise assisted in the work of the Committee.

R. C. Lannen
E. V. Boynton
R. J. Francis
Joe Anderson

Continental Oil Company
Continental Oil Company
Continental Oil Company

Eric Engbrecht
J. W. Runyan

New Mexico Oil Conservation Commission
New Mexico Oil Conservation Commission

J. W. Montgomery

Shell Oil Company

J. W. Meek

Pan American Petroleum Corporation

All of the Committee meetings were held in the Oil Conservation Commission Conference Room in Hobbs, New Mexico. The first meeting was held on July 19, 1957; subsequent all day meetings were held on July 25, August 1, August 8, August 15, August 22, and September 5. In addition to meetings of the Committee as a whole, three subcommittees held numerous meetings to complete their work assignments.

All of the agencies and companies appointed to the Committee had representatives present at each of the Committee meetings, with the exception of one meeting when one organization was unable to have a representative present.

By Committee decision the initial distribution of this final report is being restricted. In addition to the copies furnished to the Oil Conservation Commission, each designated member and alternate is to receive one copy. All have agreed to hold their copies confidential pending your decision as to the proper disposition of the report.

J. W. Brown
Acting Chairman

FINAL REPORT OF COMMITTEE
STUDYING PROTECTION OF HOBBS
FRESH WATER SANDS
SEPTEMBER 24, 1957

At the request of the City Commission of Hobbs, New Mexico, the New Mexico Oil Conservation Commission called a meeting of all operators in the Hobbs, Bowers, and Byers-Queen Pools on July 9, 1957, in Hobbs.

During that meeting and subsequently by Mr. A. L. Porter, Jr.'s letter dated July 10, 1957, a Committee was appointed to make a study of fresh water contamination in the Hobbs Pool area and make recommendations to the New Mexico Oil Conservation Commission, as to:

1. Any action that may be taken by the Commission in addition to what is presently being done to prevent further contamination;
2. Any corrective measures that may be employed to prevent further spread of present contamination.

The Committee consisted of representatives from the following companies and agencies:

Pen American Petroleum Corporation - Chairman
Samedan Oil Corporation
Shell Oil Company
Tidewater Oil Company
Continental Oil Company
Hobbs City Water Board
State Engineer's Office
Hobbs Commission Staff

After collecting additional information regarding water wells and contamination of water wells in the Hobbs Pool area, after giving consideration to existing information and all reports of fresh water contamination, and after obtaining advice and assistance from recognized authorities on ground water and from research organizations and from texts and reports on geology and petroleum engineering, the Committee concluded its study by making numerous findings with respect to the overall problem of fresh water contamination in the Hobbs Pool area.

I. The Physical Characteristics of the Ogallala Formation and the Movement of Water Through This Aquifer.

The Committee finds:

(1) The entire Hobbs Pool area is directly underlain by the Ogallala formation of Tertiary age.

(2) The Ogallala formation, in the Hobbs Pool area, is an effective fresh-water aquifer with a thickness of 175'-200' of which approximately 100'-150' is saturated with water.

(3) The regional dip of the Ogallala formation is approximately 15-20' per mile in a southeasterly direction.

(4) The Ogallala formation consists largely of fine-grained sand in varying stages of cementation and consolidation. The material of the upper 5-40' is often firmly cemented by calcium carbonate to form hard dense caliche which commonly underlies the land surface in the area. The basal portion of the Ogallala is often composed of coarse sand and gravel. Thin discontinuous clay lenses are often found interbedded within the sand of the Ogallala formation. The Ogallala is underlain by Red Beds.

(5) Clay lenses and thin zones of very fine sand which are relatively well-cemented occur within the Ogallala formation. These are not continuous or of great lateral extent. The Ogallala ground-water reservoir, therefore, is unconfined and acts as a unit.

(6) Water levels in the Hobbs Pool area have declined as much as 12' since 1940 due to large withdrawals and regional drought.

(7) Water level measurements made during August, 1957, show that water levels in the Hobbs Pool area stand at from 18-65' below the land surface. In many instances this level is below the base of the caliche.

(8) The pore space in the sand of the Ogallala formation above the water table would normally contain pellicular water and air.

(9) There would be some water saturation in the sand of the Ogallala formation above the water table due to capillary forces, depending upon the physical characteristics of the sand and the thickness of sand above the water table.

(10) Pressure in the sand of the Ogallala formation above the water table would be atmospheric unless affected by outside forces.

(11) The water table in the Ogallala formation has a gradient of 15' per mile in a southeasterly direction. The water is moving at 9 to 12' per day in that direction.

(12) A negative area of influence, called a cone of depression, is developed by wells pumping water from the Ogallala formation.

(13) The vertical and lateral extent of a cone of depression is dependent upon the rate of withdrawal, duration of pumping, and the lithologic characteristics of the aquifer within the cone of depression.

(14) Ground-water mounds, or positive areas of influence, can be created by injecting water into the Ogallala formation by recharge wells.

(15) The positive areas of influence around recharge wells probably would not be large and would exist only in the area of the recharge well.

(16) The introduction of a second or third phase, oil or gas, below the water table in the Ogallala formation would cause a reduction in the relative permeability in that portion of the Ogallala sand occupied by the oil-water-gas mixture.

(17) Where both oil and gas are present below the water table, relative permeability of the sand to oil and gas would be zero if the water saturation varied from about 88% to 100%. The relative permeability of the sand to oil and gas increases as water saturation decreases below about 88%. Therefore, oil and gas in the Ogallala formation would not move until water saturation is decreased to less than about 88% of the total pore space occupied by a mixture of water-oil-gas.

(18) Oil or gas introduced into the Ogallala formation would be free to move provided only that sufficient saturation by oil or gas occurred.

(19) Once a portion of the Ogallala sand is saturated by oil or gas, it would not be possible to reduce this oil or gas saturation below about 10-12% saturation by the reduction of pressure or by moving water through the sand.

(20) Any movement of oil or gas in the Ogallala formation below the water table would result in a minimum of about 12% of the oil or gas remaining trapped in the sand through which the oil or gas moved.

(21) Oil introduced into the Ogallala formation above the water table could result in the sand tending to become oil-wet thereby resulting in residual oil saturation much higher than if introduced below the water table.

(22) Gas produced with oil is soluble to some extent in the water of the Ogallala formation, depending upon the amount of gas in contact with the water and the pressure at the point of contact.

(23) Gas dissolved in the Ogallala water would have no effect upon the movement of the water unless free gas began breaking out of the water below the water table. In such a case a reduction in the relative permeability of the sand to water would result.

(24) Dissolved gas would move with the water in a southeasterly direction at a rate of approximately 9 to 12" per day.

(25) Gravitational forces would tend to move oil or free gas in the Ogallala formation upward toward the water table.

(26) A comparison of the water wells contaminated with oil and their relationship to the structure of the base of the caliche shows that these wells are located in the structural highs while water wells contaminated with gas are located both in structural highs and lows. Refer to Exhibit No. 1 which is a map of the Hobbs Pool area contoured on the base of the caliche.

(27) The structure of the base of the caliche could possibly affect the movement of oil and gas toward structural highs. Refer to Exhibit No. 1.

II. Apparent Contaminated Conditions Which Exist in the Ogallala Formation in the Hobbs Pool Area.

The Committee finds:

(1) A total of 378 water wells were located in the area. This includes temporarily abandoned and producing wells. It is believed that this represents about 80% of the total number of water wells in the Hobbs Pool area. The majority of these wells are plotted on Exhibit No. 1.

(2) Based on tests made by Committee members, 17 water wells are suspected to be contaminated by gas. This contamination is in varying degrees, from gas contamination sufficient enough to burn with a small intermittent flame, to a slight taste. The wells are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Gibbins	SW SE NE 4-19-38	Slight Taste Gas
Easton	SW SE NE 4-19-38	Slight Taste Gas
Gackle	SE SE NE 4-19-38	Strong Taste Gas
Security Supply	NW NE NE 5-19-38	Slight Taste Gas
Ohio Oil	SE SE SE 32-18-38	Strong Taste Gas
Baker Tool	SW SE SW 32-18-38	Slight Taste Gas
Harwell	NW NE NE 28-18-38	Strong Taste Gas
Dowell	NE NE NE 28-18-38	Will Burn
Humble Oil	SW NE SW 30-18-38	Moderate Taste Gas
Bensing	NE NW NE 30-18-38	Very Slight Taste Gas

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Green	NE NE NE 30-18-38	Very Strong Taste Gas
Mertaugh	NW NE NE 30-18-38	Old Well Would Burn
Moon	NW NE NE 30-18-38	Moderate Taste Gas
Moon	SW NE NE 30-18-38	Moderate Taste Gas
Goins	NE SE NE 30-18-38	Strong Taste Gas
Ellison L-2230	SW SE NE 30-18-38	Moderate Taste Gas
Pacific Pump	NW NE NE 5-19-38	Slight Taste Gas

One of the above water wells (Ohio) is reported to have been contaminated with gas since 1930 when the nearest oil wells were more than a mile away.

The greatest degree of gas contamination was found in the Dowell (NE NE NE 28-18-38) water well. This well proved to be contaminated to such an extent that small sporadic flames of gas were observed when a lighted match was held over an opened water faucet.

(3) Of the 378 known water wells, 9 are known to have oil standing in the well bore and 3 are reported to be oil contaminated. The wells known to have oil in the well bore are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Amerada Pet.	C N/2 29-18-38	19.4 feet
Ellison L-2230 # 1	SW NE NE 30-18-38	6.3 feet
" # 2	SE NW NE 30-18-38	0.5 feet
" # 3	SE SW NE 30-18-38	0.5 feet
" # 4	SE SW NE 30-18-38	0.8 feet
" # 5	NE SW NE 30-18-38	0.6 feet
" #11	SE NW NE 30-18-38	Trace Oil
" #12	SE SW NE 30-18-38	2.4 feet
" #13	SE SW NE 30-18-38	3.8 feet

In the case of the Ellison wells, the owner reported the presence of oil to the New Mexico Oil Conservation Commission and subsequently Commission personnel confirmed the presence of oil in the degree indicated above.

The Amerada well in which 19.4 feet of oil was found was not being produced when first inspected by Committee members. Subsequently, pumping equipment was installed and the 19.4 feet of oil was recovered. As of this date the well is pumping water and no new oil has entered the well bore. Information reported to the Committee indicates the possibility that the oil entered the well bore from the surface and not from the fresh water aquifer.

The wells reported to be contaminated by oil are located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Jackson	NE NW NW 20-18-38	Unknown
Phillips	NE NW NW 4-19-38	Unknown
Pacific Pump	NW NE NE 5-19-38	Trace

The Jackson well is reported to have oil in the well bore; however, it is the opinion of this Committee that it probably is lubricating oil from the water well pump.

(4) One well is reported to be contaminated by sewage. It is located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Phillips #6	SE NE NW 4-19-38	Unknown

(5) Forty-two wells were sampled. These samples were analyzed for chloride and sulfide content. Among these 42 water wells

are all wells that were suspected to be contaminated, the remainder being water wells near these wells. The sulfide determination did not indicate any contamination although some of the wells are known to be gas contaminated. With samples collected and analyzed by different methods, the presence of gas contamination might have been detected. A list of the wells and the results of the analysis are shown on Exhibit No. 2. Exhibit No. 3 shows the analysis of a sample collected from one of the Ellison wells during 1956 by Mr. Charles Reider, then a member of the Commission Staff.

(6) In response to the Committee's request, water analyses on 9 water wells were received from oil operators that operate water wells in the Hobbs Pool area. These analyses are included as Exhibit No. 4.

III. Feasibility of Eliminating or Removing The Apparent Contamination.

The Committee finds that there are no practical nor feasible means, now known, by which the apparent oil and gas contamination can be completely removed from the Ogallala formation for the following reasons:

(1) Evidence available gives no clear indication of the exact extent of the apparent contamination.

(2) Oil and gas contamination can exist at various depths with the same or other depths in the same area showing little or no contamination.

(3) More shallow wells evidence oil or gas contamination than deeper wells, thereby tending to confirm that oil or gas entering the Ogallala will migrate upward toward the water table.

(4) To remove oil or gas from the Ogallala, it would be necessary to flush the contaminated portion of the sand with water, draw the oil or gas into a producing water well, permit the contamination to gradually migrate or disperse, or use a combination of these methods.

(5) The combination of high withdrawal rate water wells in an area of apparent contamination encircled by recharge wells would tend to create an extended area of influence. However, the expected results in moving or flushing oil or gas would not justify the large volume of water necessary to be handled to create such an extended area of positive and negative influence.

(6) In order to decontaminate an area of oil contamination, it would be necessary to essentially remove all of the oil to prevent any further show of contamination. While it is theoretically possible to flush out the oil down to an immobile residual saturation, in practice this would be impossible.

(7) An area of gas contamination could probably be decontaminated by the use of combined high rate withdrawal and recharge wells. Even so, it would be necessary to remove gas produced with water before injecting the water in the recharge wells. Under these conditions it would be more practical to simply remove the gas from water produced for domestic purposes without a recharge program.

(8) The general and areal movement of water in the Ogallala formation in a southeasterly direction will tend to migrate or disperse the dissolved gas away from an area of apparent contamination.

IV. The Possibility of Contamination of The Hobbs City Water Supply By Migration from the Area of Apparent Contamination.

The Committee finds:

(1) Certain of the City of Hobbs water wells are located in the path of ground-water movement from the contaminated area in NE/4 30-18-38.

(2) Existing oil contamination is expected to be immobilized within the aquifer, especially in the relatively "dry" zone at the top of the aquifer, before it reaches the city wells. Further, as the city wells are completed at or near the base of the aquifer, the possibility of oil contamination has been greatly reduced.

(3) Since gas in solution may travel a great distance, certain city wells may be subject to some gas contamination in the future.

(4) Observation wells should be established and maintained between the contaminated area and the city wells.

The Hobbs City Water Board advised that the City had purchased 6 sections of water rights located 3 or 4 miles to the north and northwest of the Hobbs Pool area. These water rights are considered to be outside of any possible contamination from the Hobbs Pool area.

V. Possible Contamination of the Fresh Water in the Ogallala Formation by Sources Other Than Oil or Gas Wells Such as Sewage, Waste Oil and Acid, Open Storm Sewer Ditches, Gas Plant Waste Water, Refuse, and Oil and Oilfield Brines Held in Earthen Pits.

The Committee finds:

(1) One water well was reported to be contaminated by sewage.

(2) It was found that many service companies operating in the Hobbs Pool area are dumping waste material in earthen pits at random, thus creating a source of possible contamination. The City of Hobbs maintains a supervised pit east of the city wherein such waste can be disposed, for a nominal fee, thus eliminating this source of possible contamination to the Hobbs fresh water supply.

(3) One large storm sewer ditch exists in the southern part of the Hobbs Pool area. The depth of this ditch is such that if it does not actually penetrate the aquifer it is very close to doing so, and is considered a hazard to the underlying fresh water. Although samples of water collected from the ditch by Committee members during August, 1957, did not indicate severe contamination, the open ditch is subject to accidental severe contamination from a number of sources at any time. The analyses of two samples of water collected from the ditch are shown in Exhibit No. 5.

(4) Analyses indicate that water coming directly from the Phillips Gasoline Plant is not a potential source of contamination (196 PPM CL) but that the lake in which it accumulates is high in chlorides (3450 PPM CL). It is possible that oilfield brines are also introduced into this lake. Disposal of such brines by other means may cause the lake to become gradually lower in chlorides. See Exhibit No. 6 for more complete analyses of plant waste water.

(5) No accumulation of refuse was found that could be considered as a source of permanent contamination to the fresh water sands.

(6) It was found that numerous sources of possible contamination exist in the form of pipeline drips, tank battery burn pits, and salt water disposal pits. The latter source is expected to be eliminated in the near future after installation of proposed salt water disposal systems. Holding or disposing of oil in earthen pits is considered a possible source of contamination to the fresh water sands. This possible source of contamination can be controlled by NMOCC under existing rules and regulations.

VI. Possible Need For Rules and Regulations Governing the Drilling, Completion, and Abandonment of Water Wells in the Hobbs Pool Area.

The Committee finds:

(1) There are no rules nor regulations governing the drilling, completion, and abandonment of water wells in the Hobbs Pool area.

(2) There is a definite need for rules and regulations governing water wells to prevent further contamination of water in the Ogallala formation and to minimize the risks of producing contaminants that are now in the aquifer.

(3) Rules and regulations should, in part, govern the location, depth, casing and cementing programs, surface and sub-surface completion procedure, inspection, and abandonment of water wells.

(4) There is also a need for rules and regulations governing the drilling and abandonment of any boring or excavation that penetrates the fresh water sands.

VII. Establishment of a Water Well Observation Program To Detect Any New Contamination and to Observe the Movement, if any, of Contamination from the Area Northwest of Hobbs.

The Committee finds:

(1) At least 42 water wells, and probably more, are available for observation purposes in the Hobbs Pool area. Exhibit No. 7 is a tabulation listing these wells according to their location and accessibility to water level measurements and to water sample collection.

(2) As much information as possible should be collected regarding the potential observation wells. Such information should ideally include the driller's log, date drilled, depth, casing program, location of any perforations, and an accurate description of the well location.

(3) An effective network of observation wells can be established by evaluating the potential observation wells with regard to their location within the Hobbs Pool area and to information available regarding their completion.

VIII. The Possibility of, and Methods for, Obtaining Potable Water From the Areas of Apparent Contamination.

The Committee finds:

(1) It should be possible to obtain potable water at almost any location in the Hobbs Pool area provided that proper depth is penetrated, proper methods used to complete the water well, and reasonable caution is used in locating the well with respect to nearby possible sources of contamination.

(2) Since most contamination by oil and gas is evidenced in shallow wells, and since oil and gas will tend to migrate upward toward the water table, it would be advisable to complete water wells as deep as possible in the Ogallala, cement casing to the completion depth, seal around the top of the casing at the surface, and have the casing extend above the natural ground level.

(3) Since some evidence indicates that various depths may be contaminated, casing should be cemented so that shallower intervals can be tested if contamination is found in deeper intervals.

(4) If a water well in the Hobbs Pool area evidences contamination by oil and/or gas, this water can be made potable by removing the oil at the surface by a simple skimming or settling process. Gas can be removed by aeration. If gas contamination is severe, it might be necessary to flow the water over several cascade type trays with a layer of activated charcoal in the bottom of each. This charcoal should not require frequent replacement. If a disagreeable odor or taste of hydrogen sulfide remains a few PPM of chlorine added to the water should remove the odor and taste. Water from gas contaminated wells produced directly into and held in pressure tanks will retain gas in solution to be released when water is withdrawn.

IX. Causes of Oil and Gas Well Casing Deterioration.

The Committee finds:

Oil Conservation Commission records indicate that to this date defective casing has been repaired at 63 Hobbs Pool wells. There are numerous causes of this deterioration of casing in oil and gas wells. Some of these causes are listed as follows:

(1) Corrosive conditions are known to exist in the Hobbs Pool which can cause leaks in any casing string subjected to these conditions.

(2) Severe internal casing corrosion can result from the presence of hydrogen sulfide contained in gas produced with the Hobbs crude oil.

(3) External or internal casing corrosion can result from electrolytic action, action of sulfate reducing bacteria, or galvanic action.

(4) Stress concentrations resulting from even mild corrosion can cause failures of the well casing.

(5) Wear between the tubing and casing in pumping wells as is caused by the movement of tubing during the pumping cycle can cause casing leaks.

(6) Pressure in formations behind the casing can cause collapse of the casing.

(7) Casing will be subjected to continued high pressure from the producing formation throughout the foreseeable future. Hobbs Pool bottom hole pressures averaged 986 psig in 1954 and 941 psig in 1956, indicating very gradual decline. With continued high pressure on the casing and considering the age of the remaining Hobbs Pool wells where casing has not been repaired, the instance of casing leaks may be expected to increase during the 20-30 years remaining life of the pool.

X. Methods of Preventing or Minimizing Oil and Gas Well Casing Deterioration.

The Committee finds that there are numerous means and materials available to the oil industry by which oil and gas well casing deterioration can be minimized or eliminated. Some of these means and materials are listed as follows:

- (1) Coatings applied to the interior and/or exterior of casing.
- (2) Numerous and various chemicals injected into oil and gas wells to minimize corrosive attack.
- (3) Induced electrical current or elimination of electrical current to minimize electrolytic corrosive attack.
- (4) Spotting chemically treated mud outside of casing or circulating cement outside of casing to prevent corrosive attack by sulfate reducing bacteria.
- (5) Setting packers in the casing in or above the producing formation and filling the annular space above the packer with non-corrosive liquid.
- (6) Circulating cement between strings of casing.
- (7) Using anchors or guides to prevent tubing-on-casing wear.

XI. Methods of Determining the Existence of Defective Casing.

The Committee finds that there are numerous methods available by which defective casing can be detected. Some are listed as follows:

- (1) Internal caliper surveys to gauge the extent, depth and location of corrosive attack on the internal string of casing.
- (2) Temperature surveys to locate temperature anomalies which are possible indications of casing leaks.
- (3) Hydraulic pressure tests using packers to determine if a leak exists and to locate the leak.
- (4) Potential profile surveys to determine the probability of external casing corrosion and thereby the likelihood of casing leaks.
- (5) Bradenhead pressure surveys to determine by pressure observations on the several casing strings the possible existence of casing leaks.
- (6) Chemical analysis of produced water as an indication of a casing leak through the presence of foreign water.

(7) Lack of normal clearance between tubing and casing as an indication of possible casing collapse or of parted casing.

(8) Any observed abnormal performance of the well with respect to bottom hole pressure, gas-oil ratio, water production, or oil production.

(9) Unusual performance or presence of foreign liquid or gas in shallower oil, gas, or water wells in the vicinity.

(10) Electrical logs, permeability surveys, and radioactive tracer surveys to locate leaks or parted casing.

The method or combination of methods best adapted for any particular well will depend upon the conditions which exist at each individual well. The bradenhead pressure survey is least expensive, quicker, and very effective under proper conditions.

XII. Methods of Repairing Oil and Gas Well Casing Found to be Defective.

The Committee finds that there are numerous means by which casing can be effectively repaired. The method to be used will depend upon the conditions which exist at the individual well. Some of these methods are as follows:

(1) Recover the entire casing string found to be defective and run and cement an entirely new casing string.

(2) Run and cement a full string of smaller casing inside the defective casing.

(3) Recover that portion of the casing string found to be defective, replace casing, and re-run casing string using casing bowl overshot or other method to tie back on to and seal with casing left in the hole.

(4) Run and cement a liner covering that portion of the casing found to be defective.

(5) Circulate cement to the surface between casing strings during completion or repair operations.

(6) Squeeze cement through casing leaks and obtain a solid final build up squeeze pressure.

XIII. Programming of Bradenhead Pressure Tests on Oil and Gas Wells In the Hobbs Pool Area.

The Committee finds:

(1) Bradenhead pressure surveys, where the several casing strings are open for pressure measurement, should indicate whether or not a casing leak exists and therefore the possibility of fresh water sand contamination at the well being tested.

(2) Bradenhead pressure surveys conducted annually are too infrequent to provide adequate warning of possible contamination of the fresh water sand.

(3) Bradenhead pressure surveys conducted quarterly should provide more adequate warning of possible contamination of the fresh water sand.

(4) It should be necessary for the NMOCC to witness only one of the quarterly bradenhead pressure surveys each year.

(5) The operators of the individual wells should conduct the other three surveys, recording and saving the test results, and filing a certification with NMOCC that all wells operated by that operator have been tested and whether or not leaks were found.

(6) All producing oil and gas wells, abandoned wells, temporarily abandoned wells, and salt water disposal wells, should be scheduled for the quarterly bradenhead surveys.

(7) There are a number of old oil wells in the Hobbs Pool area with the intermediate casing set on open surface casing with clamps, thereby preventing pressure observation. Such open surface casing is a possible source of fresh water sand contamination since the top of the surface casing is in the bottom of cellars. In order to obtain valuable information during bradenhead pressure surveys and to eliminate one possible source of contamination, the top of the annular space between the clamped intermediate casing and the surface casing should be sealed and vented to the surface.

ANALYSIS OF WATER SAMPLES
FROM LARGE STORM SEWER DITCH

The chloride and sulfide content of the two water samples, each designated "open sewer, Hobbs, New Mexico", submitted August 21, 1957, was negligible. Both samples gave a negative Endo Agar Test, indicating they were free of fecal contamination.

They contained organic matter, both dissolved and in suspension, and considerable dissolved iron.

The sodium, potassium, and calcium content was 12, 4, 24 and 9, 4, 28 parts per million, respectively.

EXHIBIT NO. 6

ANALYSIS OF WASTE WATER

Phillips Gasoline Plant

Sample No. 1 - Waste water direct from plant
Date Collected - 8/6/57

Phenolphthalein end point = 550 ppm
Methyl orange (M-orange) = 620 ppm
Total hardness = 0
Chlorides = 196 ppm
Ph = 11.55
Orthophosphate = 45 ppm
Hydrogen sulfide = 0 ppm

Not considered potable but is soft. Will not scale.

Sample No. 2 - Waste water from large pit behind
Phillips Plant

Date Collected - 8/6/57
Algae growth moderate

Phenolphthalein end point = 0 ppm
Methyl orange (M-orange) = 196 ppm
Total hardness = 1700 ppm
Chlorides = 3450 ppm
Ph = 7.55
Orthophosphate = 20 ppm
Hydrogen sulfide = 0 - 1.7 ppm

Not considered potable due to hardness and chlorides.

MEMORANDUM

TO: New Mexico Oil Conservation Commission
Attention: Mr. A. L. Porter, Jr., Secretary-Director

FROM: Committee Studying Protection of
Hobbs Fresh Water Sands

SUBJECT: Final Report of the Committee

Transmitted herewith is the completed final report of the Committee. This report contains no direct recommendations since it is the consensus of the Committee that the need for any corrective action is adequately shown in the Committee findings. In some instances this corrective action is outside of the jurisdiction of the Oil Conservation Commission. We trust that you will arrange to have these matters brought to the attention of the appropriate persons or agencies.

It was the decision of the Committee that attendance at its meetings should be restricted to representatives of the agencies and companies appointed to the Committee, and to guest speakers specifically invited to a particular meeting. Mr. E. G. Minton, Lea County Hydrologist, was the only such speaker. The need for closed meetings was indicated by the somewhat negative results observed at the general meeting held in Hobbs on July 9, 1957.

The official representatives designated by each of the agencies and companies appointed to the Committee are listed as follows:

Pan American Petroleum Corporation
C. L. Kelley, Chairman, Roswell, New Mexico
J. W. Brown, Alternate, Roswell, New Mexico

Continental Oil Company
R. L. Adams, Member, Roswell, New Mexico
F. T. Elliot, Alternate, Hobbs, New Mexico

Hobbs City Water Board
L. A. Calhoun, Member, Hobbs, New Mexico
W. G. Abbot, Alternate, Hobbs, New Mexico

New Mexico Oil Conservation Commission
R. F. Montgomery, Member, Hobbs, New Mexico
E. J. Fischer, Alternate, Hobbs, New Mexico

Samedan Oil Corporation
C. W. Putman, Member, Hobbs, New Mexico
C. E. Layhe, Alternate, Hobbs, New Mexico

Shell Oil Company

W. E. Owen, Member, Hobbs, New Mexico
R. C. Cabaniss, Alternate, Hobbs, New Mexico

State Engineer's Office

Zane Spiegel, Member, Santa Fe, New Mexico
R. L. Borton, Alternate, Roswell, New Mexico

Tidewater Oil Company

H. P. Shackelford, Member, Hobbs, New Mexico
R. N. Miller, Alternate, Hobbs, New Mexico

Other representatives of the agencies and companies appointed to the Committee attended meetings as second alternates, served as members of subcommittees, or otherwise assisted in the work of the Committee.

R. C. Lannen	Continental Oil Company
E. V. Boynton	Continental Oil Company
R. J. Francis	Continental Oil Company
Joe Anderson	Continental Oil Company
Eric Engbrecht	New Mexico Oil Conservation Commission
J. W. Runyan	New Mexico Oil Conservation Commission
J. W. Montgomery	Shell Oil Company
J. W. Meek	Pan American Petroleum Corporation

All of the Committee meetings were held in the Oil Conservation Commission Conference Room in Hobbs, New Mexico. The first meeting was held on July 19, 1957; subsequent all day meetings were held on July 25, August 1, August 8, August 15, August 22, and September 5. In addition to meetings of the Committee as a whole, three subcommittees held numerous meetings to complete their work assignments.

All of the agencies and companies appointed to the Committee had representatives present at each of the Committee meetings, with the exception of one meeting when one organization was unable to have a representative present.

By Committee decision the initial distribution of this final report is being restricted. In addition to the copies furnished to the Oil Conservation Commission, each designated member and alternate is to receive one copy. All have agreed to hold their copies confidential pending your decision as to the proper disposition of the report.

J. W. Brown
Acting Chairman

FINAL REPORT OF COMMITTEE
STUDYING PROTECTION OF HOBBS
FRESH WATER SANDS
SEPTEMBER 24, 1957

At the request of the City Commission of Hobbs, New Mexico, the New Mexico Oil Conservation Commission called a meeting of all operators in the Hobbs, Bowers, and Byers-Queen Pools on July 9, 1957, in Hobbs.

During that meeting and subsequently by Mr. A. L. Porter, Jr.'s letter dated July 10, 1957, a Committee was appointed to make a study of fresh water contamination in the Hobbs Pool area and make recommendations to the New Mexico Oil Conservation Commission, as to:

1. Any action that may be taken by the Commission in addition to what is presently being done to prevent further contamination;
2. Any corrective measures that may be employed to prevent further spread of present contamination.

The Committee consisted of representatives from the following companies and agencies:

Pen American Petroleum Corporation - Chairman
Samedan Oil Corporation
Shell Oil Company
Tidewater Oil Company
Continental Oil Company
Hobbs City Water Board
State Engineer's Office
Hobbs Commission Staff

After collecting additional information regarding water wells and contamination of water wells in the Hobbs Pool area, after giving consideration to existing information and all reports of fresh water contamination, and after obtaining advice and assistance from recognized authorities on ground water and from research organizations and from texts and reports on geology and petroleum engineering, the Committee concluded its study by making numerous findings with respect to the overall problem of fresh water contamination in the Hobbs Pool area.

I. The Physical Characteristics of the Ogallala Formation and the Movement of Water Through This Aquifer.

The Committee finds:

- (1) The entire Hobbs Pool area is directly underlain by the Ogallala formation of Tertiary age.
- (2) The Ogallala formation, in the Hobbs Pool area, is an effective fresh-water aquifer with a thickness of 175'-200' of which approximately 100'-150' is saturated with water.
- (3) The regional dip of the Ogallala formation is approximately 15-20' per mile in a southeasterly direction.
- (4) The Ogallala formation consists largely of fine-grained sand in varying stages of cementation and consolidation. The material of the upper 5-40' is often firmly cemented by calcium carbonate to form hard dense caliche which commonly underlies the land surface in the area. The basal portion of the Ogallala is often composed of coarse sand and gravel. Thin discontinuous clay lenses are often found interbedded within the sand of the Ogallala formation. The Ogallala is underlain by Red Beds.

(5) Clay lenses and thin zones of very fine sand which are relatively well-cemented occur within the Ogallala formation. These are not continuous or of great lateral extent. The Ogallala ground-water reservoir, therefore, is unconfined and acts as a unit.

(6) Water levels in the Hobbs Pool area have declined as much as 12' since 1940 due to large withdrawals and regional drought.

(7) Water level measurements made during August, 1957, show that water levels in the Hobbs Pool area stand at from 18-65' below the land surface. In many instances this level is below the base of the caliche.

(8) The pore space in the sand of the Ogallala formation above the water table would normally contain pellicular water and air.

(9) There would be some water saturation in the sand of the Ogallala formation above the water table due to capillary forces, depending upon the physical characteristics of the sand and the thickness of sand above the water table.

(10) Pressure in the sand of the Ogallala formation above the water table would be atmospheric unless affected by outside forces.

(11) The water table in the Ogallala formation has a gradient of 15' per mile in a southeasterly direction. The water is moving at 9 to 12" per day in that direction.

(12) A negative area of influence, called a cone of depression, is developed by wells pumping water from the Ogallala formation.

(13) The vertical and lateral extent of a cone of depression is dependent upon the rate of withdrawal, duration of pumping, and the lithologic characteristics of the aquifer within the cone of depression.

(14) Ground-water mounds, or positive areas of influence, can be created by injecting water into the Ogallala formation by recharge wells.

(15) The positive areas of influence around recharge wells probably would not be large and would exist only in the area of the recharge well.

(16) The introduction of a second or third phase, oil or gas, below the water table in the Ogallala formation would cause a reduction in the relative permeability in that portion of the Ogallala sand occupied by the oil-water-gas mixture.

(17) Where both oil and gas are present below the water table, relative permeability of the sand to oil and gas would be zero if the water saturation varied from about 88% to 100%. The relative permeability of the sand to oil and gas increases as water saturation decreases below about 88%. Therefore, oil and gas in the Ogallala formation would not move until water saturation is decreased to less than about 88% of the total pore space occupied by a mixture of water-oil-gas.

(18) Oil or gas introduced into the Ogallala formation would be free to move provided only that sufficient saturation by oil or gas occurred.

(19) Once a portion of the Ogallala sand is saturated by oil or gas, it would not be possible to reduce this oil or gas saturation below about 10-12% saturation by the reduction of pressure or by moving water through the sand.

(20) Any movement of oil or gas in the Ogallala formation below the water table would result in a minimum of about 12% of the oil or gas remaining trapped in the sand through which the oil or gas moved.

(21) Oil introduced into the Ogallala formation above the water table could result in the sand tending to become oil-wet thereby resulting in residual oil saturation much higher than if introduced below the water table.

(22) Gas produced with oil is soluble to some extent in the water of the Ogallala formation, depending upon the amount of gas in contact with the water and the pressure at the point of contact.

(23) Gas dissolved in the Ogallala water would have no effect upon the movement of the water unless free gas began breaking out of the water below the water table. In such a case a reduction in the relative permeability of the sand to water would result.

(24) Dissolved gas would move with the water in a southeasterly direction at a rate of approximately 9 to 12" per day.

(25) Gravitational forces would tend to move oil or free gas in the Ogallala formation upward toward the water table.

(26) A comparison of the water wells contaminated with oil and their relationship to the structure of the base of the caliche shows that these wells are located in the structural highs while water wells contaminated with gas are located both in structural highs and lows. Refer to Exhibit No. 1 which is a map of the Hobbs Pool area contoured on the base of the caliche.

(27) The structure of the base of the caliche could possibly effect the movement of oil and gas toward structural highs. Refer to Exhibit No. 1.

II. Apparent Contaminated Conditions Which Exist in the Ogallala Formation in the Hobbs Pool Area.

The Committee finds:

(1) A total of 378 water wells were located in the area. This includes temporarily abandoned and producing wells. It is believed that this represents about 80% of the total number of water wells in the Hobbs Pool area. The majority of these wells are plotted on Exhibit No. 1.

(2) Based on tests made by Committee members, 17 water wells are suspected to be contaminated by gas. This contamination is in varying degrees, from gas contamination sufficient enough to burn with a small intermittent flame, to a slight taste. The wells are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Gibbins	SW SE NE 4-19-38	Slight Taste Gas
Easton	SW SE NE 4-19-38	Slight Taste Gas
Gackle	SE SE NE 4-19-38	Strong Taste Gas
Security Supply	NW NE NE 5-19-38	Slight Taste Gas
Ohio Oil	SE SE SE 32-18-38	Strong Taste Gas
Baker Tool	SW SE SW 32-18-38	Slight Taste Gas
Harwell	NW NE NE 28-18-38	Strong Taste Gas
Dowell	NE NE NE 28-18-38	Will Burn
Humble Oil	SW NE SW 30-18-38	Moderate Taste Gas
Bensing	NE NW NE 30-18-38	Very Slight Taste Gas

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Green	NE NE NE 30-18-38	Very Strong Taste Gas
Mertaugh	NW NE NE 30-18-38	Old Well Would Burn
Moon	NW NE NE 30-18-38	Moderate Taste Gas
Moon	SW NE NE 30-18-38	Moderate Taste Gas
Goins	NE SE NE 30-18-38	Strong Taste Gas
Ellison L-2230	SW SE NE 30-18-38	Moderate Taste Gas
Pacific Pump	NW NE NE 5-19-38	Slight Taste Gas

One of the above water wells (Ohio) is reported to have been contaminated with gas since 1930 when the nearest oil wells were more than a mile away,

The greatest degree of gas contamination was found in the Dowell (NE NE NE 28-18-38) water well. This well proved to be contaminated to such an extent that small sporadic flames of gas were observed when a lighted match was held over an opened water faucet.

(3) Of the 378 known water wells, 9 are known to have oil standing in the well bore and 3 are reported to be oil contaminated. The wells known to have oil in the well bore are as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Amerada Pet.	C N/2 29-18-38	19.4 feet
Ellison L-2230 # 1	SW NE NE 30-18-38	6.3 feet
" # 2	SE NW NE 30-18-38	0.5 feet
" # 3	SE SW NE 30-18-38	0.5 feet
" # 4	SE SW NE 30-18-38	0.8 feet
" # 5	NE SW NE 30-18-38	0.6 feet
" #11	SE NW NE 30-18-38	Trace Oil
" #12	SE SW NE 30-18-38	2.4 feet
" #13	SE SW NE 30-18-38	3.8 feet

In the case of the Ellison wells, the owner reported the presence of oil to the New Mexico Oil Conservation Commission and subsequently Commission personnel confirmed the presence of oil in the degree indicated above.

The Amerada well in which 19.4 feet of oil was found was not being produced when first inspected by Committee members. Subsequently, pumping equipment was installed and the 19.4 feet of oil was recovered. As of this date the well is pumping water and no new oil has entered the well bore. Information reported to the Committee indicates the possibility that the oil entered the well bore from the surface and not from the fresh water aquifer.

The wells reported to be contaminated by oil are located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Jackson	NE NW NW 20-18-38	Unknown
Phillips	NE NW NW 4-19-38	Unknown
Pacific Pump	NW NE NE 5-19-38	Trace

The Jackson well is reported to have oil in the well bore; however, it is the opinion of this Committee that it probably is lubricating oil from the water well pump.

(4) One well is reported to be contaminated by sewage. It is located as follows:

<u>Name</u>	<u>Location</u>	<u>Degree of Contamination</u>
Phillips #6	SE NE NW 4-19-38	Unknown

(5) Forty-two wells were sampled. These samples were analyzed for chloride and sulfide content. Among these 42 water wells

are all wells that were suspected to be contaminated, the remainder being water wells near these wells. The sulfide determination did not indicate any contamination although some of the wells are known to be gas contaminated. With samples collected and analyzed by different methods, the presence of gas contamination might have been detected. A list of the wells and the results of the analysis are shown on Exhibit No. 2. Exhibit No. 3 shows the analysis of a sample collected from one of the Ellison wells during 1956 by Mr. Charles Reider, then a member of the Commission Staff.

(6) In response to the Committee's request, water analyses on 9 water wells were received from oil operators that operate water wells in the Hobbs Pool area. These analyses are included as Exhibit No. 4.

III. Feasibility of Eliminating or Removing The Apparent Contamination.

The Committee finds that there are no practical nor feasible means, now known, by which the apparent oil and gas contamination can be completely removed from the Ogallala formation for the following reasons:

(1) Evidence available gives no clear indication of the exact extent of the apparent contamination.

(2) Oil and gas contamination can exist at various depths with the same or other depths in the same area showing little or no contamination.

(3) More shallow wells evidence oil or gas contamination than deeper wells, thereby tending to confirm that oil or gas entering the Ogallala will migrate upward toward the water table.

(4) To remove oil or gas from the Ogallala, it would be necessary to flush the contaminated portion of the sand with water, draw the oil or gas into a producing water well, permit the contamination to gradually migrate or disperse, or use a combination of these methods.

(5) The combination of high withdrawal rate water wells in an area of apparent contamination encircled by recharge wells would tend to create an extended area of influence. However, the expected results in moving or flushing oil or gas would not justify the large volume of water necessary to be handled to create such an extended area of positive and negative influence.

(6) In order to decontaminate an area of oil contamination, it would be necessary to essentially remove all of the oil to prevent any further show of contamination. While it is theoretically possible to flush out the oil down to an immobile residual saturation, in practice this would be impossible.

(7) An area of gas contamination could probably be decontaminated by the use of combined high rate withdrawal and recharge wells. Even so, it would be necessary to remove gas produced with water before injecting the water in the recharge wells. Under these conditions it would be more practical to simply remove the gas from water produced for domestic purposes without a recharge program.

(8) The general and areal movement of water in the Ogallala formation in a southeasterly direction will tend to migrate or disperse the dissolved gas away from an area of apparent contamination.

IV. The Possibility of Contamination of The Hobbs City Water Supply By Migration from the Area of Apparent Contamination.

The Committee finds:

- (1) Certain of the City of Hobbs water wells are located in the path of ground-water movement from the contaminated area in NE/4 30-18-38.
- (2) Existing oil contamination is expected to be immobilized within the aquifer, especially in the relatively "dry" zone at the top of the aquifer, before it reaches the city wells. Further, as the city wells are completed at or near the base of the aquifer, the possibility of oil contamination has been greatly reduced.
- (3) Since gas in solution may travel a great distance, certain city wells may be subject to some gas contamination in the future.
- (4) Observation wells should be established and maintained between the contaminated area and the city wells.

The Hobbs City Water Board advised that the City had purchased 6 sections of water rights located 3 or 4 miles to the north and northwest of the Hobbs Pool area. These water rights are considered to be outside of any possible contamination from the Hobbs Pool area.

V. Possible Contamination of the Fresh Water in the Ogallala Formation by Sources Other Than Oil or Gas Wells Such as Sewage, Waste Oil and Acid, Open Storm Sewer Ditches, Gas Plant Waste Water, Refuse, and Oil and Oilfield Brines Held in Earthen Pits.

The Committee finds:

- (1) One water well was reported to be contaminated by sewage.
- (2) It was found that many service companies operating in the Hobbs Pool area are dumping waste material in earthen pits at random, thus creating a source of possible contamination. The City of Hobbs maintains a supervised pit east of the city wherein such waste can be disposed, for a nominal fee, thus eliminating this source of possible contamination to the Hobbs fresh water supply.
- (3) One large storm sewer ditch exists in the southern part of the Hobbs Pool area. The depth of this ditch is such that if it does not actually penetrate the aquifer it is very close to doing so, and is considered a hazard to the underlying fresh water. Although samples of water collected from the ditch by Committee members during August, 1957, did not indicate severe contamination, the open ditch is subject to accidental severe contamination from a number of sources at any time. The analyses of two samples of water collected from the ditch are shown in Exhibit No. 5.
- (4) Analyses indicate that water coming directly from the Phillips Gasoline Plant is not a potential source of contamination (196 PPM CL) but that the lake in which it accumulates is high in chlorides (3450 PPM CL). It is possible that oilfield brines are also introduced into this lake. Disposal of such brines by other means may cause the lake to become gradually lower in chlorides. See Exhibit No. 6 for more complete analyses of plant waste water.
- (5) No accumulation of refuse was found that could be considered as a source of permanent contamination to the fresh water sands.

(6) It was found that numerous sources of possible contamination exist in the form of pipeline drips, tank battery burn pits, and salt water disposal pits. The latter source is expected to be eliminated in the near future after installation of proposed salt water disposal systems. Holding or disposing of oil in earthen pits is considered a possible source of contamination to the fresh water sands. This possible source of contamination can be controlled by NMOCC under existing rules and regulations.

VI. Possible Need For Rules and Regulations Governing the Drilling, Completion, and Abandonment of Water Wells in the Hobbs Pool Area.

The Committee finds:

(1) There are no rules nor regulations governing the drilling, completion, and abandonment of water wells in the Hobbs Pool area.

(2) There is a definite need for rules and regulations governing water wells to prevent further contamination of water in the Ogallala formation and to minimize the risks of producing contaminants that are now in the aquifer.

(3) Rules and regulations should, in part, govern the location, depth, casing and cementing programs, surface and sub-surface completion procedure, inspection, and abandonment of water wells.

(4) There is also a need for rules and regulations governing the drilling and abandonment of any boring or excavation that penetrates the fresh water sands.

VII. Establishment of a Water Well Observation Program To Detect Any New Contamination and to Observe the Movement, if any, of Contamination from the Area Northwest of Hobbs.

The Committee finds:

(1) At least 42 water wells, and probably more, are available for observation purposes in the Hobbs Pool area. Exhibit No. 7 is a tabulation listing these wells according to their location and accessibility to water level measurements and to water sample collection.

(2) As much information as possible should be collected regarding the potential observation wells. Such information should ideally include the driller's log, date drilled, depth, casing program, location of any perforations, and an accurate description of the well location.

(3) An effective network of observation wells can be established by evaluating the potential observation wells with regard to their location within the Hobbs Pool area and to information available regarding their completion.

VIII. The Possibility of, and Methods for, Obtaining Potable Water From the Areas of Apparent Contamination.

The Committee finds:

(1) It should be possible to obtain potable water at almost any location in the Hobbs Pool area provided that proper depth is penetrated, proper methods used to complete the water well, and reasonable caution is used in locating the well with respect to nearby possible sources of contamination.

(2) Since most contamination by oil and gas is evidenced in shallow wells, and since oil and gas will tend to migrate upward toward the water table, it would be advisable to complete water wells as deep as possible in the Ogallala, cement casing to the completion depth, seal around the top of the casing at the surface, and have the casing extend above the natural ground level.

(3) Since some evidence indicates that various depths may be contaminated, casing should be cemented so that shallower intervals can be tested if contamination is found in deeper intervals.

(4) If a water well in the Hobbs Pool area evidences contamination by oil and/or gas, this water can be made potable by removing the oil at the surface by a simple skimming or settling process. Gas can be removed by aeration. If gas contamination is severe, it might be necessary to flow the water over several cascade type trays with a layer of activated charcoal in the bottom of each. This charcoal should not require frequent replacement. If a disagreeable odor or taste of hydrogen sulfide remains a few PPM of chlorine added to the water should remove the odor and taste. Water from gas contaminated wells produced directly into and held in pressure tanks will retain gas in solution to be released when water is withdrawn.

IX. Causes of Oil and Gas Well Casing Deterioration.

The Committee finds:

Oil Conservation Commission records indicate that to this date defective casing has been repaired at 63 Hobbs Pool wells. There are numerous causes of this deterioration of casing in oil and gas wells. Some of these causes are listed as follows:

(1) Corrosive conditions are known to exist in the Hobbs Pool which can cause leaks in any casing string subjected to these conditions.

(2) Severe internal casing corrosion can result from the presence of hydrogen sulfide contained in gas produced with the Hobbs crude oil.

(3) External or internal casing corrosion can result from electrolytic action, action of sulfate reducing bacteria, or galvanic action.

(4) Stress concentrations resulting from even mild corrosion can cause failures of the well casing.

(5) Wear between the tubing and casing in pumping wells as is caused by the movement of tubing during the pumping cycle can cause casing leaks.

(6) Pressure in formations behind the casing can cause collapse of the casing.

(7) Casing will be subjected to continued high pressure from the producing formation throughout the foreseeable future. Hobbs Pool bottom hole pressures averaged 966 psig in 1954 and 941 psig in 1956, indicating very gradual decline. With continued high pressure on the casing and considering the age of the remaining Hobbs Pool wells where casing has not been repaired, the instance of casing leaks may be expected to increase during the 20-30 years remaining life of the pool.

X. Methods of Preventing or Minimizing Oil and Gas Well Casing Deterioration.

The Committee finds that there are numerous means and materials available to the oil industry by which oil and gas well casing deterioration can be minimized or eliminated. Some of these means and materials are listed as follows:

- (1) Coatings applied to the interior and/or exterior of casing.
- (2) Numerous and various chemicals injected into oil and gas wells to minimize corrosive attack.
- (3) Induced electrical current or elimination of electrical current to minimize electrolytic corrosive attack.
- (4) Spotting chemically treated mud outside of casing or circulating cement outside of casing to prevent corrosive attack by sulfate reducing bacteria.
- (5) Setting packers in the casing in or above the producing formation and filling the annular space above the packer with non-corrosive liquid.
- (6) Circulating cement between strings of casing.
- (7) Using anchors or guides to prevent tubing-on-casing wear.

XI. Methods of Determining the Existence of Defective Casing.

The Committee finds that there are numerous methods available by which defective casing can be detected. Some are listed as follows:

- (1) Internal caliper surveys to gauge the extent, depth and location of corrosive attack on the internal string of casing.
- (2) Temperature surveys to locate temperature anomalies which are possible indications of casing leaks.
- (3) Hydraulic pressure tests using packers to determine if a leak exists and to locate the leak.
- (4) Potential profile surveys to determine the probability of external casing corrosion and thereby the likelihood of casing leaks.
- (5) Bradenhead pressure surveys to determine by pressure observations on the several casing strings the possible existence of casing leaks.
- (6) Chemical analysis of produced water as an indication of a casing leak through the presence of foreign water.

(7) Lack of normal clearance between tubing and casing as an indication of possible casing collapse or of parted casing.

(8) Any observed abnormal performance of the well with respect to bottom hole pressure, gas-oil ratio, water production, or oil production.

(9) Unusual performance or presence of foreign liquid or gas in shallower oil, gas, or water wells in the vicinity.

(10) Electrical logs, permeability surveys, and radioactive tracer surveys to locate leaks or parted casing.

The method or combination of methods best adapted for any particular well will depend upon the conditions which exist at each individual well. The bradenhead pressure survey is least expensive, quicker, and very effective under proper conditions.

XII. Methods of Repairing Oil and Gas Well Casing Found to be Defective.

The Committee finds that there are numerous means by which casing can be effectively repaired. The method to be used will depend upon the conditions which exist at the individual well. Some of these methods are as follows:

(1) Recover the entire casing string found to be defective and run and cement an entirely new casing string.

(2) Run and cement a full string of smaller casing inside the defective casing.

(3) Recover that portion of the casing string found to be defective, replace casing, and re-run casing string using casing bowl overshot or other method to tie back on to and seal with casing left in the hole.

(4) Run and cement a liner covering that portion of the casing found to be defective.

(5) Circulate cement to the surface between casing strings during completion or repair operations.

(6) Squeeze cement through casing leaks and obtain a solid final build up squeeze pressure.

XIII. Programming of Bradenhead Pressure Tests on Oil and Gas Wells In the Hobbs Pool Area.

The Committee finds:

(1) Bradenhead pressure surveys, where the several casing strings are open for pressure measurement, should indicate whether or not a casing leak exists and therefore the possibility of fresh water sand contamination at the well being tested.

(2) Bradenhead pressure surveys conducted annually are too infrequent to provide adequate warning of possible contamination of the fresh water sand.

(3) Bradenhead pressure surveys conducted quarterly should provide more adequate warning of possible contamination of the fresh water sand.

(4) It should be necessary for the NMOCC to witness only one of the quarterly bradenhead pressure surveys each year.

(5) The operators of the individual wells should conduct the other three surveys, recording and saving the test results, and filing a certification with NMOCC that all wells operated by that operator have been tested and whether or not leaks were found.

(6) All producing oil and gas wells, abandoned wells, temporarily abandoned wells, and salt water disposal wells, should be scheduled for the quarterly bradenhead surveys.

(7) There are a number of old oil wells in the Hobbs Pool area with the intermediate casing set on open surface casing with clamps, thereby preventing pressure observation. Such open surface casing is a possible source of fresh water sand contamination since the top of the surface casing is in the bottom of cellars. In order to obtain valuable information during bradenhead pressure surveys and to eliminate one possible source of contamination, the top of the annular space between the clamped intermediate casing and the surface casing should be sealed and vented to the surface.

EXHIBIT NO. 2

ANALYSIS OF 42 SELECTED WATER WELLS IN HOBBS POOL AREA

Analysis was to include only sulfide and chloride content.
However no sulfides were identified.

EXHIBIT NO. 5

ANALYSIS OF WATER SAMPLES
FROM LARGE STORM SEWER DITCH

The chloride and sulfide content of the two water samples, each designated "open sewer, Hobbs, New Mexico", submitted August 21, 1957, was negligible. Both samples gave a negative Endo Agar Test, indicating they were free of fecal contamination. They contained organic matter, both dissolved and in suspension, and considerable dissolved iron. The sodium, potassium, and calcium content was 12, 4, 24 and 9, 4, 28 parts per million, respectively.

EXHIBIT NO. 6

ANALYSIS OF WASTE WATER

Phillips Gasoline Plant

Sample No. 1 - Waste water direct from plant
Date Collected - 8/6/57

Phenolphthalein end point = 550 ppm
Methyl orange (M-orange) = 620 ppm
Total hardness = 0
Chlorides = 196 ppm
Ph = 11.55
Orthophosphate = 45 ppm
Hydrogen sulfide = 0 ppm

Not considered potable but is soft. Will not scale.

Sample No. 2 - Waste water from large pit behind
Phillips Plant
Date Collected - 8/6/57
Algae growth moderate

Phenolphthalein end point = 0 ppm
Methyl orange (M-orange) = 196 ppm
Total hardness = 1700 ppm
Chlorides = 3450 ppm
Ph = 7.55
Orthophosphate = 20 ppm
Hydrogen sulfide = 0 - 1.7 ppm

Not considered potable due to hardness and chlorides.
