**RE: 3rd Quarter 2012 Groundwater Monitoring Results
Hobbs Booster Station, Lea County New Mexico (AP-114)
Unit C and D, Section 4, Township 19 South, Range 38 East**

RECEIVED
1/13/2013
CD

Dear Mr. Lowe:

DCP Midstream, LP (DCP), is pleased to submit for your review, a one copy of the 3rd Quarter 2012 Groundwater Monitoring Report for the DCP Hobbs Booster Station located in Hobbs, New Mexico (Unit C and D Section 4, T19S, R38E (32.696 degrees North, 103.156 degrees West).

If you have any questions regarding the report, please call me at 303-605-1718 or email me at sweathers@dcpmidstream.com.

Sincerely

DCP Midstream, LP

Stephen Weathers, P.G.
Principal Environmental Specialist

Appendices

- A Laboratory Analytical Results
- B Historical Analytical Results

1. Introduction

This report summarizes the remediation system activities and results of groundwater monitoring activities conducted during the third quarter of 2012, at the Hobbs Booster Station (Site) in Lea County, New Mexico (Figure 1). Tasman Geosciences, LLC (Tasman) conducted these activities on behalf of DCP Midstream, LP (DCP). The purpose of the groundwater monitoring activities described herein were to: a) determine the presence of light non-aqueous phase liquid (LNAPL) hydrocarbons; b) measure groundwater levels; c) obtain groundwater samples for chemical analysis; and d) evaluate and present groundwater flow and quality conditions. The field data and laboratory analytical results collected during the reporting period were used to develop a groundwater elevation contour map and an analytical results map to evaluate current conditions at the Site.

2. Site Location and Background

The Site is located in New Mexico Oil Conservation Division (OCD) designated Units C and D, Section 4, Township 19 South, Range 38 East (Figure 1). The facility coordinates are 32.696 degrees north and 103.156 degrees west. This facility is no longer used as an active gas compression facility or product transfer Site; currently the Site is primarily used as a DCP field office and as an overhaul shop. All ancillary equipment and buildings associated with the former Booster Station have been decommissioned and/or demolished.

The Site currently has 30 groundwater monitoring wells, which are illustrated on Figure 2. Twenty-seven of the wells are located on the Site property while the other three wells, MW-23, MW-24, and MW-25, are located to the southeast of the property boundary on land currently owned by Occidental Permian.

An LNAPL recovery and soil vapor extraction (SVE) system utilizing LNAPL recovery pumps and vacuum blower units are present the Site. There are 28 dual phase extraction wells (Figure 2) located on-Site including MW-4, MW-8, MW-11, and MW-13 which were previously converted from monitoring wells due to the historically high levels of LNAPL observed in those wells. Additionally, the Site operates an air-sparge (AS) cut-off system that was installed along the south-central Site boundary and includes 21 AS injection wells connected in series (Figure 2). LNAPL, AS, and SVE system operation and performance are described in Section 4.

3. Groundwater Monitoring

This section describes the field groundwater monitoring activities as well as laboratory analyses performed during the third quarter 2012 monitoring event. Monitoring activities included Site-wide groundwater gauging, LNAPL measurements, groundwater purging and sampling, and subsequent packaging and shipping of the samples to the laboratory for chemical analyses. Figure 2 illustrates the groundwater monitoring network utilized to perform these activities at the Site.

3.1 Groundwater and LNAPL Elevation Monitoring

Groundwater and LNAPL levels were measured in order to evaluate hydraulic characteristics and provide information regarding fluctuations in groundwater and LNAPL elevations at the Site. In addition, wells that did not have LNAPL present were measured for total depth and recorded for subsequent use to estimate groundwater purge volumes. During the third quarter 2012 monitoring event groundwater and LNAPL levels, if present, were measured at 24 monitoring well locations.

The wells were gauged on the north side of the well casing to the nearest 0.01-foot using an oil-water interface probe (IP). Groundwater levels were subsequently converted to elevations (feet above mean sea level [AMSL]).

Groundwater elevations collected during the third quarter 2012 monitoring event are presented in Table 1 and a groundwater elevation contour map is illustrated on Figure 3. Groundwater elevations ranged from 3567.49 feet AMSL in monitoring wells MW-19D to 3576.33 feet AMSL at monitoring well MW-6. There was an average decrease in groundwater elevation of 0.16 feet from the previous quarter across the site. As illustrated on Figure 3, groundwater flow at the Site generally trends to the east with a gradient of approximately 0.004 foot per foot between monitoring wells MW-6 and MW-21.

LNAPL was detected in nine of the measured groundwater monitoring wells with thicknesses ranging between 0.16-feet in MW-18 to 6.60-feet in MW-12. Calculated groundwater elevation data in these wells were corrected to account for LNAPL thickness and density.

3.2 Groundwater Quality Monitoring

Prior to collecting groundwater samples, groundwater levels, the presence of LNAPL, and the total depth of the wells (in wells without LNAPL) were measured as previously described. A minimum of three well casing volumes of groundwater (calculated from total depth of the well and groundwater level measurements) was then purged using dedicated polyethylene bailers from the subject well prior to the collection of groundwater samples. Groundwater samples were collected using dedicated polyethylene bailers, placed in clean laboratory supplied containers specific to the selected analytical methods and packed in an ice-filled cooler and maintained at approximately four (4) degrees Celsius ($^{\circ}\text{C}$) for transportation. Groundwater samples were then shipped under chain-of-custody procedures to Accutest Laboratories (Accutest) in Wheat Ridge, Colorado, for analysis.

Water quality samples were collected from 14 monitoring wells during the third quarter 2012 monitoring event conducted on September 6, 2012. MW-7 was dry and could not be sampled. MW-1, MW-2, MW-9, MW-10, MW-12, MW-17, MW-18, TW-K, and TW-N were not sampled due to the presence of measurable LNAPL detected in these wells. Water quality samples were submitted to Accutest for benzene, toluene, ethylbenzene, and xylene (BTEX) analyses by United States Environmental Protection Agency (USEPA) Method 8260B.

Table 2 summarizes BTEX concentrations in groundwater samples collected during the September 6, 2012 event. Analytical results are also summarized on Figure 4. Laboratory analytical reports for the event are included in Appendix A and historical analytical results up to and including the September 2012 event are contained in Appendix B.

Water quality parameters were collected during the third quarter 2012 monitoring event and were used to confirm groundwater stabilization prior to sample collection. The Site monitoring wells did not require collection of more than three (3) purge volumes to achieve parameter stabilization. As such, the analytical data are considered to be representative of Site conditions in that a minimum 3 purge volumes were evacuated from all sampled monitoring wells during the third quarter 2012 event.

3.3 Data Quality Assurance / Quality Control

A trip blank, matrix spike or matrix spike duplicate (MS/MSD) and two field duplicate samples (MW-15 and MW-19D) were collected during the sampling event. The data were reviewed for compliance with the analytical method and the associated quality assurance/quality control (QA/QC) procedures. All samples were analyzed using the correct analytical methods and within the correct holding times. Chain of custody forms were in order and properly executed and indicate that samples were received at the proper temperature with no headspace. All data were reported using the correct method number and reporting units. The trip blank was fully in control, having no detections of targets.

One duplicate sample collected at MW-15 was in compliance with QA/QC standards. MW-15 and associated duplicate sample returned results for benzene of 0.0033 mg/l and 0.003 mg/l respectively. A second duplicate sample collected at MW-19D which was in compliance with QA/QC standards. MW-19D and associated duplicate sample returned results for benzene of 0.00072 mg/l and 0.00058 mg/l respectively.

The overall QA/QC assessment of the data, based on the data review, indicate that both field precision and overall data precision and accuracy are acceptable.

4. Remediation System Performance

Remediation system activities are described in this section. The performance sections for the LNAPL, SVE, and AS systems are based on historic data as well as data collected during the reporting period.

4.1 Remediation System Layout

The remediation system consists of 28- dual phase extraction wells that can be configured to operate in SVE, LNAPL recovery, or combined SVE and LNAPL recovery. The recovery well array spans an area that is approximately 1,000 feet east to west and 800 feet north to south (estimated 15 acres of surface area). In addition to the extraction well network, there are 22 AS wells aligned west and east to create an 870-foot long dissolved phase hydrocarbon boundary control feature.

4.2 SVE Performance Evaluation

The SVE system was shut down during the second quarter 2012 to allow for equilibration and gauging of LNAPL and groundwater fluid levels at the Site recovery wells. The SVE system will remain off as interim fluid level and LNAPL recovery data are gathered in preparation for modifications to the existing product collection system.

4.3 LNAPL Recovery Performance Evaluation

On June 14, 2012, the LNAPL recovery and SVE System was shut down to allow for stabilization of LNAPL and groundwater levels within the subsurface. Stabilization of the liquid levels at the site will help to determine LNAPL distribution, thickness, and recovery characteristics inherent at the site. LNAPL recovery was re-initiated on August 2, 2012 with Spill Buster units operating at recovery wells PW-JJ and PW-G.

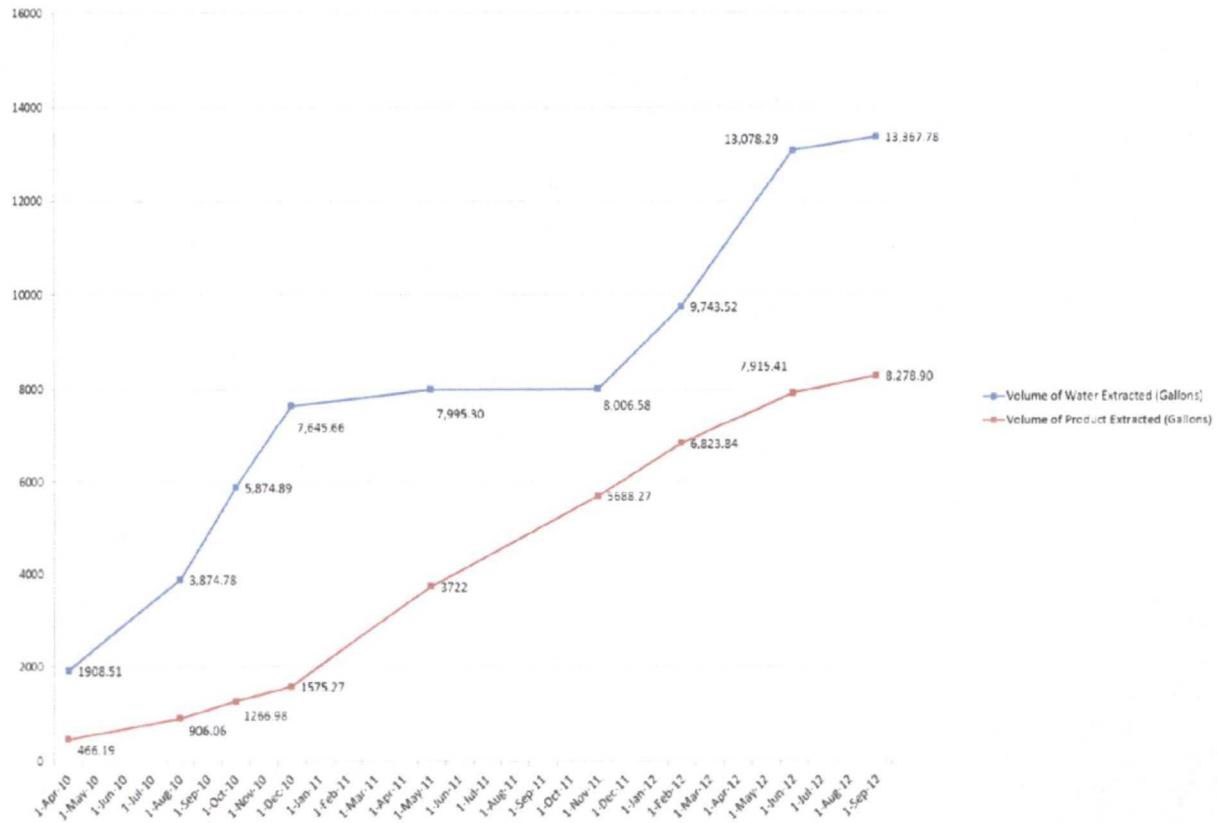

As of September 25, 2012 the Spill Buster system operating at PW-JJ and PW-G has extracted approximately 1,263-gallons of LNAPL since the units first became operational. During the reporting period, PW-JJ averaged an LNAPL extraction rate of 3.96 gallons per day (gpd) and PW-G averaged an LNAPL extraction rate of 0.65 gpd. Both units have operated with no downtime and have maintained minimal LNAPL thickness in the recovery wells.

Incremental and cumulative recovery volumes through the third quarter 2012 are summarized in the table and figure below. LNAPL recovery rates have stabilized through the third quarter of 2012 and incidental groundwater extraction has been completely eliminated.

System Fluid Recovery Summary

System Recovery Volume	Water	LNAPL
1st Quarter 2012	1,725.67	368.44
2nd Quarter 2012	2,658.04	794.56
3 rd Quarter 2012	289.49	363.49
Total	4,673.2	1,526.49

Totalized Recovered Groundwater and LNAPL Volumes
Hobbs Booster Station
Lea County, New Mexico

4.4 Air Sparge Performance Evaluation

The AS system has continued to operate on a 24-hour per day basis with minor down time due to routine scheduled equipment maintenance. The primary evaluation criteria for AS performance is tied to the dissolved phase hydrocarbon concentrations present in groundwater downgradient to the AS well alignment. Monitoring wells MW-14, MW-15, and MW-23, located immediately downgradient from the sparge curtain, provide ideal monitoring locations for observing effects the AS system has on impacted groundwater as it passes through the treatment zone. On the east end of the AS system, monitoring well MW-14 continues to exhibit low dissolved benzene concentrations, however, MW-23 which is located immediately downgradient to MW-14, continues to have no detectable concentrations of benzene or other dissolved petroleum hydrocarbons. On the west end of the AS system, lab data indicates that no dissolved phase hydrocarbon impacts are present in the vicinity of MW-15.

5. Conclusions

This section of the report presents conclusions from the findings of third quarter 2012 groundwater monitoring and remediation system O&M activities.

- Of the fourteen monitoring wells sampled this quarter, one (MW-14) had dissolved phase petroleum hydrocarbon impacts in exceedence of the New Mexico Water Quality Control Commission Standard for benzene. In addition, point-of-compliance wells located downgradient of the source area continue to indicate that LNAPL and/or dissolved phase impacts have not migrated beyond the historic area of impact. As verified by the information cited above, it can be concluded that the remedial approach at the Site is effectively addressing the hydrocarbon impacts in the historic release area and preventing the hydrocarbon plume from expanding downgradient;
- During the third quarter 2012, the LNAPL detected in monitoring well MW-10 increased from the initial thickness detected in March 2012 suggesting a subsurface migration of free phase hydrocarbons in the central portion of the Site.
- Based on groundwater concentrations in the vicinity of the AS trench, the cut off system appears to be addressing dissolved phase hydrocarbon concentrations in groundwater along both the eastern and western alignment of the trench, and;
- LNAPL recovery rates have stabilized from 1st quarter 2012, due primarily to the Spill Buster pump in operation at PW-JJ. Based on the success of the PW-JJ unit, initiation of LNAPL recovery utilizing a Spill Buster Pump at PW-G was initiated during the third quarter of 2012 to further mitigate LNAPL at the boundary of the recovery system. Design and installation plans for

installation of additional Spill Buster units throughout the extraction well network are currently under development.

6. Recommendations

Based on evaluation of current and historical groundwater and LNAPL data as well as remediation system performance data, recommendations have been developed for future activities, as described below:

- Ongoing quarterly groundwater monitoring and sampling activities will provide for continued monitoring of dissolved phase BTEX concentration and LNAPL trends;
- Continue AS and LNAPL recovery system operation and maintenance, and;
- Continue product pump evaluation and further refine plans to augment LNAPL recovery at the Site.

Average change in groundwater elevation since the previous monitoring event								-0.16

Notes:

- 1- Depths measured from the north edge of the well casing.
 - 2- Total depths were collected and recorded during the third quarter 2012 monitoring event. Total depths were not collected in wells that contained LNAPL.
 - 3- Changes in groundwater elevation calculated by subtracting the measurement collected during the previous monitoring event from the measurement collected during the most recent monitoring event.
- Data presented for all well locations includes previous four sampling events, when available. Historic groundwater analytical results for these locations may be found in Appendix B.

Sample locations are shown on Figure 2 and a groundwater elevation contour map is shown on Figure 3.

amsl - feet above mean sea level.

TOC - top of casing.

NM - Not Measured.

* Groundwater elevation was corrected for product thickness using the following calculation:

Groundwater elevation = (TOC Elevation - Measured Depth to Water) + (LNAPL Thickness in Well * LNAPL Density)

LNAPL density was assumed to be approximately 0.75 grams per cubic centimeter

Notes:

1.) The environmental cleanup standards for groundwater that are applicable to this Site are the New Mexico Water Quality Control Commission (NMWQCC) Groundwater Standards.

2.) Data presented for all other well locations includes previous four sampling events, when available. Historic groundwater analytical results for these locations may be found in Appendix B.

Bold red values indicate an exceedance of the NMWQCC groundwater standards for the Site.

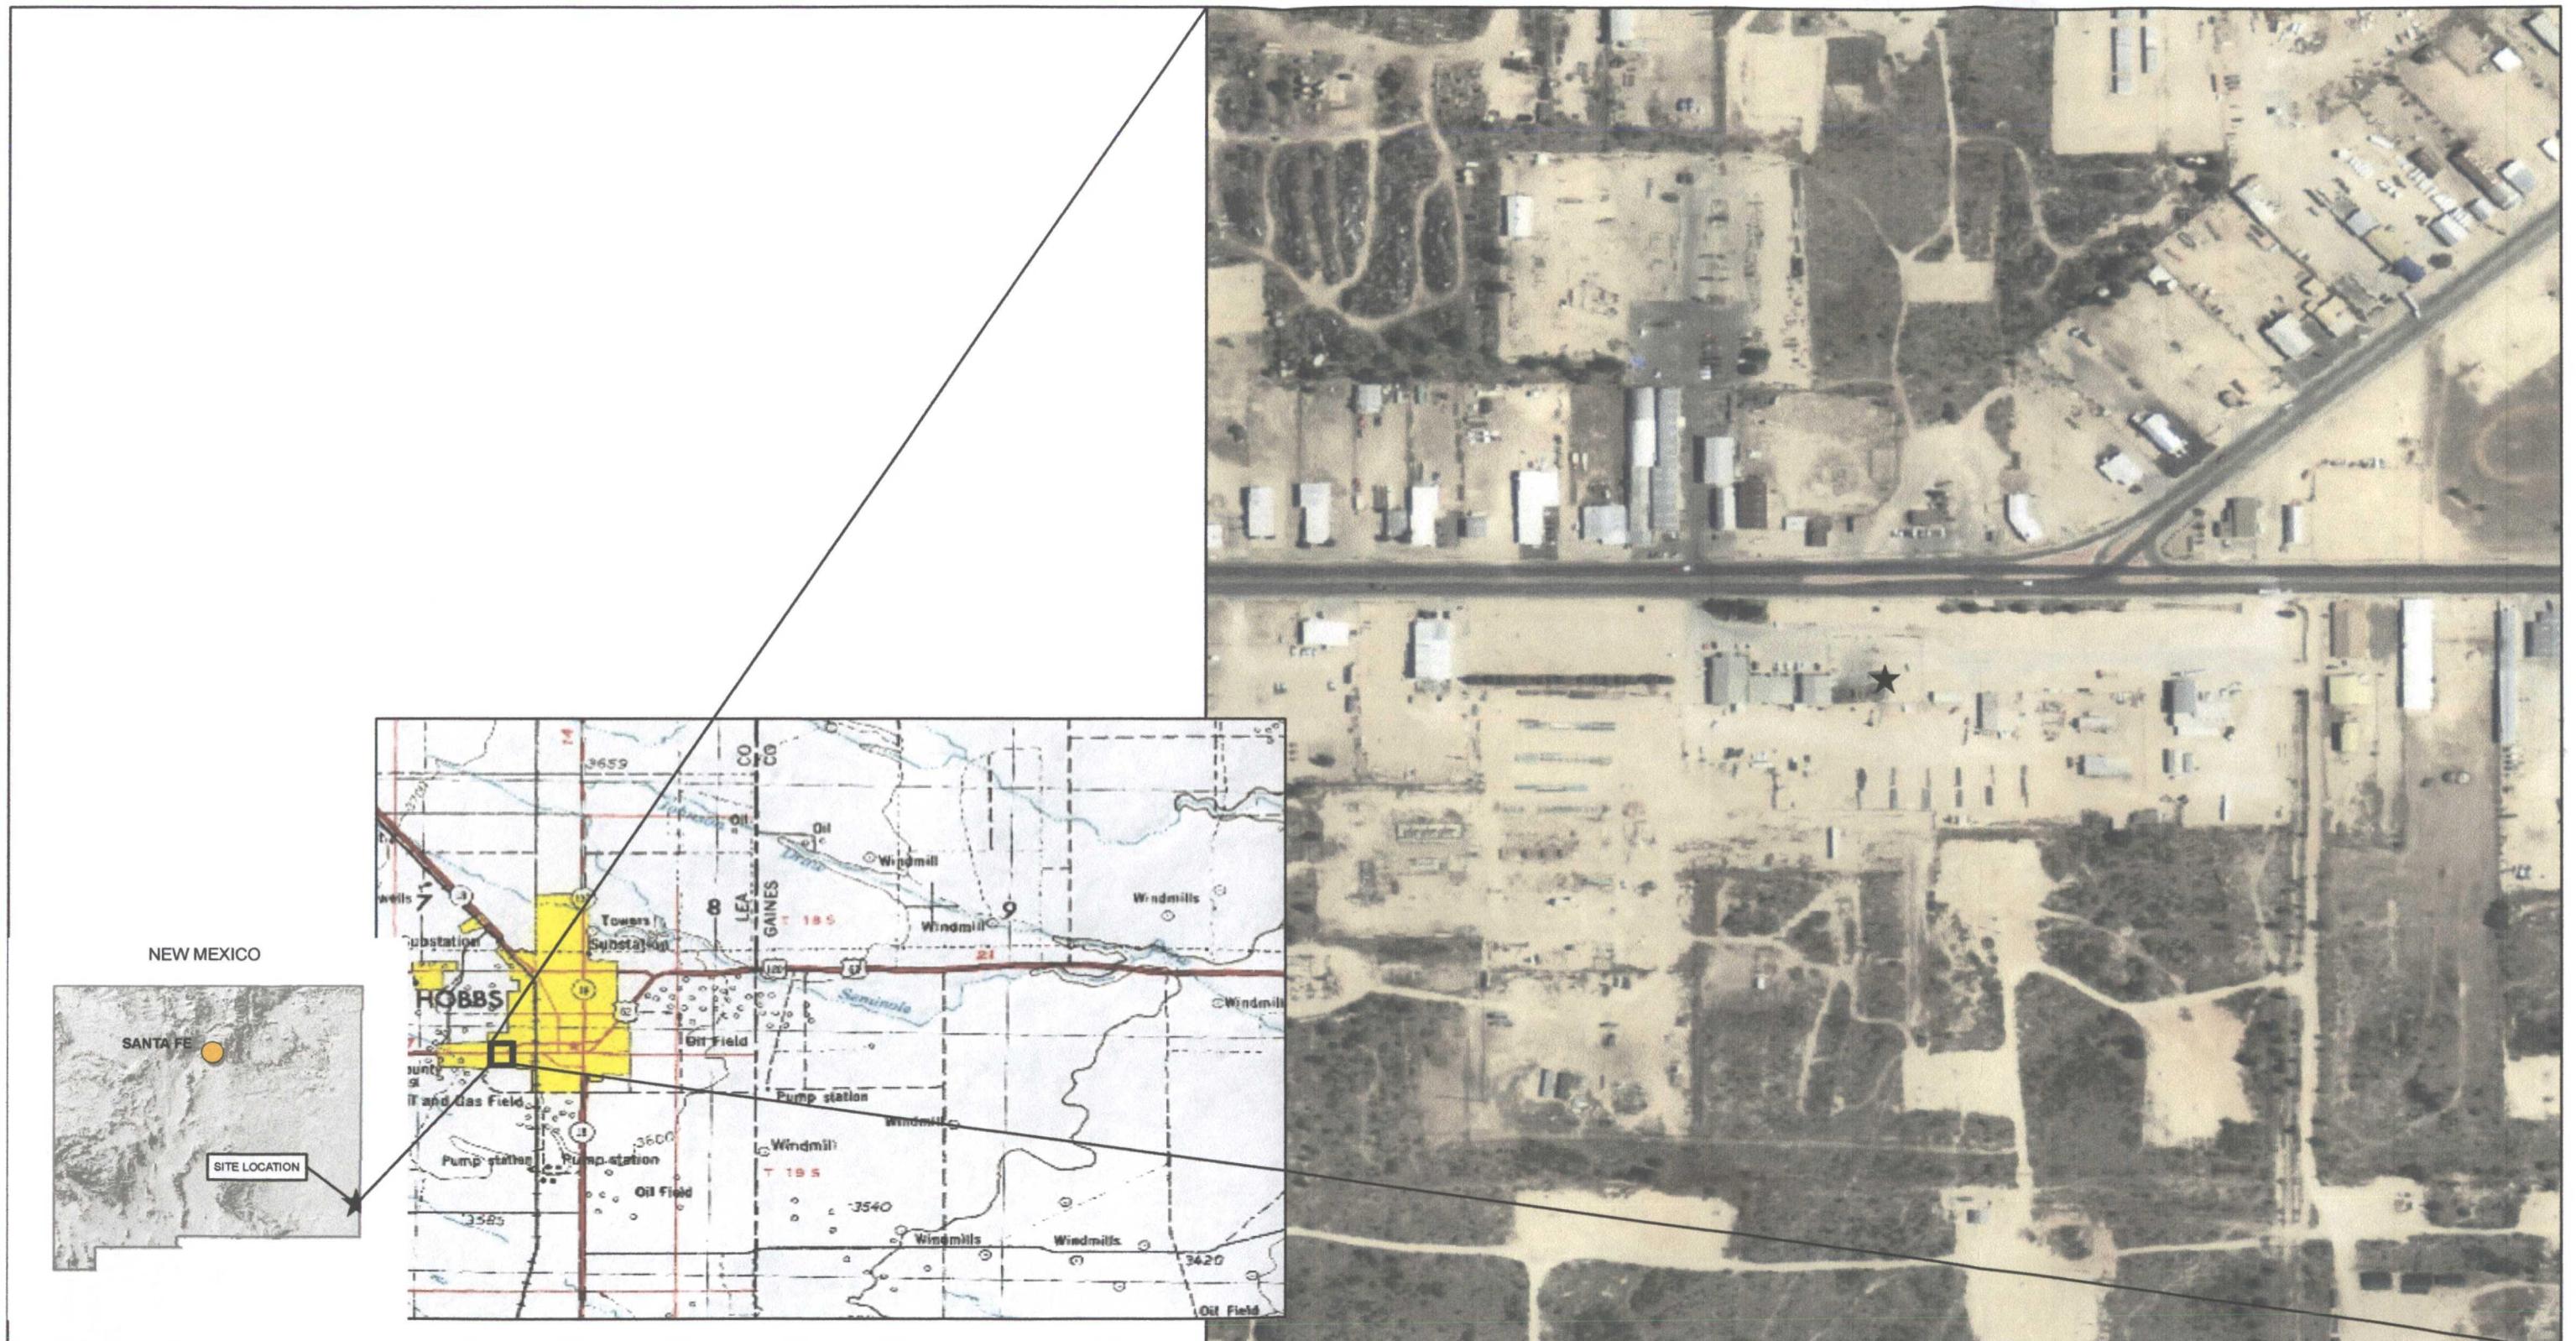

Sample locations are shown on Figure 2 and analytical results are illustrated on Figure 4.

LNAPL = Light Non-Aqueous Phase Liquid

NS = Not sampled.

mg/L = milligrams per liter.

SP-3	3/19/2008	0.0012	0.0015	<0.00045	<0.0014	

Notes:

- 1.) The environmental cleanup standards for groundwater that are applicable to this Site are the New Mexico Water Quality Control Commission
- 2.) Data presented for all other well locations includes previous four sampling events, when available. Historic groundwater analytical results for these **Bold red values** indicate an exceedance of the NMWQCC groundwater standards for the Site.

Sample locations are shown on Figure 2 and analytical results are illustrated on Figure 4.

LNAPL = Light Non-Aqueous Phase Liquid

NS = Not sampled.

mg/L = milligrams per liter.
