Re: 2010 Annual Groundwater Monitoring Report
Targa Midstream Services, L.P., Monument Gas Plant (GW-025)
Lea County, New Mexico

Dear Mr. Von Gonten:

The enclosed report is submitted to the New Mexico Oil Conservation Division on behalf of Targa Midstream Services, L. P. (Targa) to present the results of groundwater monitoring performed at the Monument Gas Plant for the 2010 calendar year.

If you have any questions or concerns, please call me or Mark Larson, P.G. at 432.687.0901.

Sincerely,

LARSON & ASSOCIATES, INC.

1.0 EXECUTIVE SUMMARY

This report presents the 2010 groundwater monitoring results for the Targa Midstream Services, L.P. (Targa) Monument Gas Plant (Facility) located approximately 2.6 miles southeast of Monument, in Unit N (SE/4, SW/4), Section 36, Township 19 South, Range 36 East, Lea County, New Mexico. The Facility operates under New Mexico Oil Conservation Division (OCD) discharge permit GW-025.

The following activities occurred during 2010:

- First Quarter Gauging Event – March 1, 2010
- Second Quarter Gauging/First Semi-Annual Groundwater Sampling Event – May 8 – 9, 2010
- Third Quarter Gauging Event – September 29, 2010
- Fourth Quarter Gauging/Second Semi-Annual Groundwater Sampling Event – November 8 – 9, 2010

The following observations are documented in this report:

- Groundwater flow remains bifurcating to the south and southeast at a gradient of about 0.004 feet per foot
- Monitoring well WP-02 remained dry, as it has since September 20, 2007
- Hydrocarbon product was present in wells WP-14 (November 2010), WP-15 (March, May, September and November 2010), WP-17 and WP-18 (March 2010)
- Benzene and chloride remain contaminants of concern in and exceed the New Mexico Water Quality Control Commission (WQCC) standards in most wells
- Barium is the only metal consistently found in above the WQCC standard and appears to be a disassociation byproduct that is naturally occurring within the soil
- The dissolved phase hydrocarbon plume has been delineated

Targa requests approval for annual (one yearly) monitoring for BTEX, general water chemistry, and gauging for hydrocarbon product. Documentation will be kept at the Facility and available to the OCD for inspection. Targa will notify the OCD at least 48 hours prior to the annual monitoring events, and as soon as possible upon any significant change in analyte concentrations.

March 11, 2011

2.0 INTRODUCTION

This report presents the results of groundwater monitoring at the Monument Gas Plant (Site) owned by Versado Gas Processors, L.P. and operated by Targa Midstream Services, L.P. (Targa) and is submitted to the New Mexico Oil Conservation Division (OCD) for compliance with groundwater discharge permit GW-025. The Site is located in Unit N (SE/4, SW/4), Section 36, Township 19 South, Range 36 East in Lea County, New Mexico. The geodetic position is north 32° 36' 37.79" and west 103° 18' 37.98". Figure 1 presents a location and topographic map. Figure 2 presents an aerial photograph. Figure 3a presents a Site drawing.

2.1 Chronology

The following events have been documented in connection with the Monument Gas Plant (GW-025):

- | | |
|------------------|--|
| c. 1935 | The Monument Gas Plant is constructed by Natural Gasoline Corporation, a subsidiary of Warren Petroleum. |
| January 26, 1936 | Monument Gas Plant started up for Amerada Petroleum Corporation, later sold back to Warren Petroleum. |
| 1946 | El Paso Corporation constructs compressor station southeast of Gas Plant. |
| April 1962 | Climax Chemical Company (Climax) begins operations north-northwest of the Gas Plant. Climax produces hydrochloric acid (HCl), sulfuric acid, and sodium sulfate. Location of Climax Plant chosen for nearby salt deposits. HCl stored in unlined surface impoundments. UST onsite, but closed prior to registration requirements. |
| c. 1976 - 1977 | Monument Gas plant upgraded to Cryo, Amine system, and SRU. |
| Prior to 1982 | Climax plugs and abandons brine wells where previously fresh water was pumped down to evaporites between 2,420 and 2,616 feet bgs to dissolve and return to the surface (Preliminary Review Report, Climax Chemical, 1987). |
| 1982 | Justification for No Discharge Plan And Alternative Application for Discharge Plan submitted to State of New Mexico by Climax. |
| Prior to 1983 | A produced condensate release occurs at the Monument Gas Plant (no date, volume or location in records). |
| June 15, 1987 | Preliminary Review Report, Climax Chemical Company issued for RCRA Facility Assessment. EPA analyses from discharge pipe to HCl surface impoundment indicate 15,500 – 17,300 ppm chloride, and 15,100 – 19,000 ppm sulfate at a pH 3.3. |
| Prior to 1989 | Hydrocarbons found in Climax wells (1-2 miles south of facility). |
| March 29, 1989 | OCD representatives Mr. David Boyer and Mr. Roger Anderson inspect Monument Gas Plant's new brine pond liner. "While inspecting the brine pond they noticed the Climax Chemical plant discharging salt water into an open area. Some of this water had broken through a dam (Warren) had built along our property fence and was leaking onto (Warren) property... In addition they asked about the oil processing company located to the south of our plant saying they did not have any record of them." (March 30, 1989 Warren Memorandum) |
| March 30, 1989 | Condensate recovery commences at Monument Gas Plant in monitor wells WP-01, WP-02, WP-03 and Climax 5-9. |
| August 4, 1989 | Warren Petroleum submits to OCD map of monitor wells and pumping records – |

March 11, 2011

to date 5.8 gallons condensate recovered at an average of 300 – 500 milliliters every 4 – 6 days.

October 6, 1989 Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 2,054.3 gallons condensate recovered.

December 18, 1989 Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 8,643.5 gallons condensate recovered at an average of 110 gallons per day.

August 6, 1990 Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 18,088.5 gallons condensate recovered at an average of 42 gallons per day.

August 16, 1991 State of New Mexico Hazardous and Radioactive Materials Bureau (HRMB) sent letter to Mr. Jimmy T. Cooper, landowner, notifying him of Climax’s request for Alternative Concentration Limits (ACL). Justifications include, “Immediately adjacent to and downgradient of Climax Chemical is the Warren Petroleum Company (Chevron) refinery. The upper-most aquifer beneath the refinery has been significantly impacted by hydrocarbon contamination. Due to past oil-field brine contamination of this same aquifer the Oil Conservation Division (OCD) of New Mexico Energy Minerals and Natural Resources Department is only requiring the refinery to recover hydrocarbon product floating on top of the groundwater within the aquifer.”

October 2, 1991 Warren Petroleum submits to OCD map of monitor wells and pumping records – to date 26,348.5 gallons condensate recovered at an average of 20 gallons per day.

October 30, 1991 PIANO analysis conducted by Southern Petroleum Laboratories, Inc. (SPL) on samples from Waste Oil, Condensate, and groundwater wells. Groundwater sample has a Pristine (first peak after C17) to Phytane (first peak after C18) ratio of 1.492; Waste Oil has 1.071; Condensate has neither Pristane nor Phytane.

March 11, 1992 Climax files bankruptcy. Disposal Well DP-298 permit modified to accept HCl injected into a San Andres limestone for neutralization. Also evaluated as a Salt Water Disposal well. (Currently in operation 4/2009)

July 6, 1994 OCD requests Warren Petroleum to submit a workplan to complete the definition of the extent of groundwater contamination.

October 31, 1994 Warren Petroleum submits workplan to OCD to include the installation of soil borings and monitor wells.

February 22 – 24, 1995 Four soil borings (SB-3 to SB-7) and seven monitor wells (WP-04 to WP-10) installed.

March 28, 1995 HRMB notification letter to Warren Petroleum of “...at least 2 feet of oil product floating on top of the groundwater...” in well #12-9. (This well is upgradient from the Monument Plant). Letter further requests Warren to determine if a pipeline from the Monument Greyburg-San Andres Field had a leak prior to 1991.

April 21, 1995 Geraghty & Miller submits Liquid Hydrocarbon Assessment for Warren Petroleum review. Major report findings are: impacted shallow groundwater is not a viable water resource; groundwater quality upgradient and around the plant is not suitable for drinking water, livestock or irrigation use; the horizontal and vertical extent of the impacted area is defined; and the sources of contamination are not limited to the Gas Plant, but also include upgradient

March 11, 2011

sources.

May 2, 1995 Warren Petroleum submits Liquid Hydrocarbon Assessment to OCD.

June 20, 1995 OCD requests: additional groundwater delineation; installing and operating a product recovery system in WP-2, WP-3, and WP-10; and quarterly monitoring.

August 31, 1995 Warren Petroleum submits response to OCD proposing: a monitor well adjacent to the Climax well; an additional monitor well east of WP-10; and additional wells to the east of WP-10 as needed.

September 26, 1995 OCD approves August 31st workplan.

Prior to October 31, 1995 WP-08 and WP-09 converted to cathodic protection wells.

November 8 - 9, 1995 Geraghty & Miller install WP-11 through WP-15 (data reported in February 29, 1996 report).

June 14, 1996 Warren Petroleum submits to the OCD groundwater elevation and product thickness maps for July - December 1995, and request change from semi-annual to annual reporting.

August 9, 1996 OCD grants request to change to annual reporting.

February 14, 1997 Geraghty & Miller submits Annual Summary Report for 1996 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south, with a static head drop of approximately 0.5 feet across the site. Hydrocarbon recovery system expansion to include WP-11 and WP-13 recommended.

March 25, 1997 OCD responds to February 14th report and approves recommendations.

April 1997 Hydrocarbon recovery operations ceased due to low water table conditions and pump limitations.

March 10, 1998 ARCADIS Geraghty & Miller submits Annual Summary Report for 1997 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south. Decreased monitoring frequency requested.

June 22, 1998 OCD approves changing monitoring frequency from quarterly to semiannually.

February 17, 2000 ARCADIS Geraghty & Miller submits Annual Report for 1999 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the south.

April 20, 2001 ARCADIS Geraghty & Miller submits Annual Report for 2000 Groundwater Monitoring Activities for OCD review.

July 25, 2001 LAI on behalf of Dynegy submits Groundwater Discharge Plan GW-025 to OCD.

January 9, 2002 ARCADIS Geraghty & Miller submits Annual Report for 2001 Groundwater Monitoring Activities for OCD review. Groundwater is reportedly bifurcating towards the southeast and the east.

January 17, 2002 OCD approves the Groundwater Discharge Plan with conditions.

February 11, 2003 LAI submits Subsurface Investigation Report to OCD.

March 6, 2003 OCD acknowledges receipt of the Subsurface Investigation Report and requests additional monitor wells to the east, south and west of the plant.

March 18, 2003 LAI submits to the OCD on behalf of Dynegy, 2002 Annual Groundwater Monitoring Report.

April 24, 2003 OCD requests a workplan for "additional downgradient and lateral controls on the extent of hydrocarbon contamination of groundwater."

March 11, 2011

June 27, 2003	Workplan submitted to OCD for groundwater investigations at the Monument Gas Plant plume.
September 10, 2003	OCD approves Monument Gas Plant groundwater investigation.
October 7, 2003	LAI submits to Dynege a summary of gas chromatography fingerprint analyses for PSH from WP-04, WP-06, and WP-15 (6/10/2003 data); a summary of PSH thicknesses for WP-04 and WP-15 during 2002-2003; groundwater analyses summary; maps of PSH thickness; and bar graphs of hydrocarbon thickness measurements.
November 14, 2003	Dynege submits to the OCD Workplan for Monitoring Well Installation at Monument Gas Plant.
January 4, 2004	LAI submits to the OCD the results of North (#2) Brine Pond subsurface closure investigation. Three hand auger borings to 7 feet bgs and three soil borings to 30 feet bgs installed.
March 18, 2004	LAI submits 2003 Annual Groundwater Monitoring Report for OCD review.
May 15, 2005	LAI submits 2004 Annual Groundwater Monitoring Report for OCD review.
May 18, 2005	Email from OCD requesting additional monitor wells downgradient of WP-04, and WP-12 & WP-14.
August 4, 2005	LAI installs WP-16, WP-17, and WP-18 in the downgradient direction. WP-17 and WP-18 exceed WQCC values for benzene.
November 1, 2005	LAI submits Free Product Investigation Report to OCD documenting the installation of WP-04R, WP-16, WP-17, and WP-18.
February 25, 2006	LAI submits 2005 Annual Groundwater Monitoring Report for OCD review. Continued quarterly groundwater monitoring recommended.
March 3, 2006	LAI submits to the OCD the Brine Pond #1 closure plan.
July 17, 2007	LAI submits 2006 Annual Report, Monument Plant Ground Water Monitoring for OCD review.
September 29, 2008	LAI submits 2007 Groundwater Monitoring Report for OCD review.
September 30, 2008	LAI installs five soil borings in the (#1) South Brine Pond as part of closure investigation.
October 21, 2008	OCD approves closure plan for (#2) North Brine Pond.
December 29, 2008	LAI installs monitor wells WP-19 and WP-20 upgradient and downgradient of the (#2) North Brine Pond, respectively, and adjacent to – and downgradient of – the Climax facility. Chloride in groundwater is 17,700 mg/l and 7,780 mg/l, respectively.
May 26 – 27, 2009	WP-21, WP-22, and WP-23 installed and achieves lateral and downgradient hydrocarbon plume delineation.
July 16, 2009	North (#2) Brine Pond Closure Report submitted to OCD.
July 17, 2009	South (#1) Brine Pond Investigation Report submitted to OCD.

2.2 Topography

The Site elevation is approximately 3,575 feet above mean sea level as shown on the Monument South, New Mexico (1985) USGS 7.5-Minute Quadrangle Map. The topographic region is the relatively flat *Laguna Valley* section of the *Querecho Plains*. The facility vicinity slopes gently to the southeast. A current topographic map is included as Figure 1.

March 11, 2011

2.3 Geology

The *Geologic Map of New Mexico* (2003) indicates the surface geology is comprised of Holocene to mid-Pleistocene age piedmont alluvial deposits. The description indicates this material includes deposits of higher gradient tributaries bordering major stream valleys, alluvial veneers of the piedmont slope, and alluvial fans. Locally, it may include the uppermost Pliocene deposits.

Subsurface conditions at the Site primarily consist of Ogallala Formation unconformably overlying Chinle redbeds. Following deposition of the Ogallala, a prolonged period of erosion reworked the fringe areas of the Ogallala creating the Mescalero Ridge, north of the facility. The reworked Ogallala deposits form the bulk of the alluvial material that has accumulated in the Laguna Valley (Nicholson and Clebsch, 1961). The site is located on the edge of the Laguna Valley where a relatively thin sequence of alluvial material is present at the surface.

Monitor well boring logs indicate a general lithology of a two- to 12-foot thick layer of unconsolidated sand over an 18- to 35-foot thickness of carbonate-indurated sand (caliche). Beneath the caliche layer is a clayey sand or red-bed clay. The geology encountered in the monitor wells is interpreted from the top-down to be a thin sequence of Holocene to Pleistocene aged eolian and alluvial sands deposited unconformably on a sequence of Miocene-Pliocene age Ogallala Formation alluvial sands. Much of the remaining Ogallala sequence is now calcified. This caliche layer most likely represents an *in situ* carbonate inter-granular deposition at the funicular vadose zone from continued deflation of the groundwater surface as erosion deepened the ancestral stream channels, and/or deposition in the pendular vadose zone by the down-driving of carbonates by precipitation, leaving a residual during dry period evaporation.

Groundwater occurs only in the bottom portion of the Ogallala in the vicinity of the Site. The Ogallala Formation is also unconformably deposited on Triassic-aged Chinle redbeds. To collect adequate groundwater in monitor wells to determine static potentiometric surface elevation, most of the wells are completed with a sump extending into the Chinle Formation.

2.4 Surface Water Occurrence

There are no streams, springs, or ponds on the facility, or within two miles of the Site. The nearest surface water is the ephemeral "South" Monument Draw south of the facility, Monument Springs north of the facility, and the ephemeral "North" Monument Draw east of the facility.

The nearest spring, Monument Springs, is located about two miles north of the Site in Section 26, Township 19 South, Range 36 East, where groundwater in the Ogallala deposits discharge at the contact with the underlying and impermeable Chinle redbeds.

2.5 Groundwater Occurrence

Regional direction for groundwater flow is towards the southeast, with variations occurring near pumping stresses and subsurface features. No water wells were identified on the Office of the New Mexico State Engineer database for Section 36, Township 19 South, Range 36 East.

March 11, 2011

An early investigation by Nicholson and Clebsch (1961) produced a groundwater map that indicates a ridge in the "redbeds" that bisects the Site from the north to south and splits groundwater into two lobes – a west lobe moving to the south, as well as an east lobe moving to the southeast. This ridge was also described as a "nose" by Geohydrology Associates, Inc., in the circa 1982 report prepared for the Climax Chemical plant (*Justification for No Discharge Plan and Alternative Application for Discharge Plan*, page 15"). The early investigations also mention widespread historic chloride contamination in groundwater prior to 1955, and the occurrence of "oil stain on water" or "strong odor" reported in four diverse locations in 1961 and 1981.

Light non-aqueous phase liquid (LNAPL) and depth to groundwater were measured in twenty monitoring wells on March 1, May 24, September 24 and November 8, 2010. The measurements were collected at the top of the PVC well casing with an electronic oil and water interface probe that was decontaminated between wells with a solution of Alconox® detergent and water and rinsed with commercially available distilled water. LNAPL was observed in four wells (WP-14, WP-15, WP-17 and WP-18) from 0.01 to 0.1 feet thick and consistent with natural gas condensate.

The depth to groundwater decreased between about 1.01 (WP-23) and 4.14 (WP-22) feet between May and November 2010, indicating rising groundwater conditions that may be attributed to seasonal fluctuation from recharge. Table 1 presents a summary of the LNAPL and depth to groundwater measurements. Depth to groundwater measurements from May 24 and November 11, 2010, were used to prepare groundwater potentiometric maps presented in Figure 3b and 3c, respectively.

On May 24, 2010, depth to groundwater varied between about 26.78 (WP-10) and 40.22 (WP-22) feet below top of casing (TOC). The groundwater elevation ranged from approximately 3557.07 feet above mean seal level (MSL) at WP-19 (up gradient) to 3534.25 feet above MSL at WP-23 (down gradient). This map also shows the west lobe with groundwater moving to the south and east lobe with groundwater moving to the southeast.

On November 8, 2010, depth to groundwater varied between about 24.39 (WP-10) and 38.14 (WP-17) feet below TOC. The groundwater elevation ranged from approximately 3559.24 feet above MSL at WP-19 (up gradient) to 3535.26 feet above MSL at WP-23 (down gradient). This map shows the west lobe with groundwater moving to the south and east lobe with groundwater moving to the southeast. The groundwater gradient is approximately 0.004 feet per foot.

3.0 GROUNDWATER SAMPLES AND LABORATORY ANALYSIS

Groundwater samples were collected from the monitoring wells during two semi-annual events on May 24 and 25, 2010 and November 8 and 9, 2010. Samples were not collected from WP-14, WP-15 and WP-17 due to the presence of LNAPL. The groundwater samples were collected after removing approximately three well volumes of groundwater or purging dry with dedicated disposable polyethylene bailers or pumping with an electric submersible pump and dedicated disposable tubing. The samples were carefully transferred to laboratory containers that were labeled, sealed with custody labels, packed in an ice filled chest and delivered under chain of custody control to DHL Analytical, Inc. (DHL), a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory located in Round Rock, Texas. All metals samples were laboratory-filtered to exclude particles larger than 0.45µ and acidified with nitric acid within 24-hours of collection. DHL analyzed the samples for benzene, toluene, ethylbenzene, xylene (BTEX) by method SW-8021B, filtered metals (arsenic, barium,

March 11, 2011

cadmium, chromium, lead, mercury, selenium, silver) by methods SW-6020 and 7470A, anions, alkalinity and total dissolved solids (TDS) by methods E-300, M2320B and M2540, respectively. A duplicate sample was collected from WP-19 during each event as a blind sample that the laboratory analyzed for quality assurance and quality control (QA/QC). Water was contained in a portable tank and discharged to the facility's process water system for disposal in a permitted Class II injection well. The laboratory analytical reports are presented on a CD ROM in Appendix A.

3.1 BTEX Analysis

Benzene concentrations observed during the life of this investigation indicate no clear increasing or decreasing trends except WP-1. Upward movement of groundwater in the capillary fringe may account for increases in benzene concentrations reported during the November 2010 sample event. All benzene values represent dissolved-phase concentrations that are well below the benzene solubility limit of 1,770 milligrams per liter (mg/L). Toluene, ethylbenzene and xylenes were below the New Mexico Water Quality Control Commission (WQCC) human health standards of 0.75 mg/L (toluene and ethylbenzene) and 0.62 mg/L (xylenes). Table 2 presents a summary of the BTEX analysis.

May 2010 Benzene Results

The following samples from the east lobe exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- WP-10 (2.19 mg/L)
- WP-11 (4.02 mg/L)
- WP-12 (1.51 mg/L)
- WP-13 (0.0575 mg/L)
- WP-14 (0.0848 mg/L)
- WP-18 (0.343 mg/L)

The following samples from the west lobe exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- WP-01 (0.107 mg/L)
- WP-05 (0.0171 mg/L)

A comparison of the primary (WP-19, <0.0008 mg/L) and duplicate (<0.0008 mg/L) samples indicate no deviation. No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-15 and WP-17, therefore, no samples were collected during this event. Figure 4a presents a concentration map of dissolved benzene concentrations reported in groundwater samples from the May 2010 sampling event.

November 2010 Benzene Results

The following samples from the east lobe exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- WP-10 (4.13 mg/L)
- WP-11 (4.76 mg/L)
- WP-12 (1.37 mg/L)
- WP-13 (0.0647 mg/L)
- WP-17 (2.61 mg/L)

The following samples from the west lobe exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- WP-01 (0.148 mg/L)
- WP-04 (0.216 mg/L)
- WP-04R (0.108 mg/L)
- WP-05 (0.2210 mg/L)

March 11, 2011

A comparison of the primary (WP-19, <0.0008 mg/l) and duplicate (<0.0008 mg/L) samples indicates no deviation. No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-14 and WP-17, therefore, no samples were collected during this event. Figure 4b presents a concentration map of dissolved benzene concentrations reported in groundwater samples from the November 2010 sampling event.

3.2 Dissolved Metals Analysis

Only barium was observed in select wells at concentrations above the WQCC human health standard of 1.0 mg/L during the May 2010 and November 2010 sampling events. Other metals including chromium, lead and selenium have been observed sporadically above the WQCC human health standards. Arsenic, cadmium, mercury and silver have not been observed at concentrations exceeding the associated WQCC human health standards during any monitoring event. Table 3 presents a cumulative summary of the dissolved metals analyses.

Barium concentrations observed over the life of this investigation indicate there no clear increasing or decreasing trends. The spatial distribution of barium above the WQCC human health standard of 1.0 mg/L is primarily east and southeast of the facility. The historically highest concentrations (69.2 to 82.9 mg/L) have been observed in WP-17, which is located offsite and southeast of the facility.

May 2010 Barium Results

The following samples from the east lobe exhibited barium concentrations above the WQCC human health standard of 1.0 mg/L:

- WP-10 (2.03 mg/L)
- WP-11 (2.30 mg/L)
- WP-12 (1.12 mg/L)
- WP-18 (2.21 mg/l)

The following samples from the west lobe exhibited barium concentrations above the WQCC human health standard of 1.0 mg/L:

- WP-01 (4.30 mg/L)

A comparison of the primary (WP-19, 0.0756 mg/L) and duplicate (0.0736 mg/L) samples indicate a 2.65% sample variance, which is within data acceptance criteria. No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-15 and WP-17, therefore, no samples were collected during this event.

November 2010 Barium Results

The following samples from the east lobe exhibited barium concentrations above the WQCC human health standard of 1.0 mg/L:

- WP-10 (2.37 mg/L)
- WP-11 (2.24 mg/L)
- WP-12 (1.30 mg/L)

The following samples from the west lobe exhibited barium concentrations above the WQCC human health standard of 1.0 mg/L:

- WP-01 (5.51 mg/L)

March 11, 2011

A comparison of the primary (WP-19, 0.0398 mg/L) and duplicate (0.0441 mg/L) samples indicate a 10.80% sample variance, which is within data acceptance criteria. No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-14 and WP-17, therefore, no samples were collected during this event.

3.3 General Chemistry Analysis

Chloride, sulfate and TDS were above the WQCC domestic water quality standards of 250 mg/L, 600 mg/L and 1,000 mg/L, respectively, in all sampled monitor wells except WP-01. Chlorides, sulfate, and TDS concentrations over time have very similar trends and appear linear with neither increasing nor decreasing trends exhibited. A widespread chloride and TDS plume originates from the Climax Chemical plant located northwest (up gradient) of the facility and the highest chloride and TDS concentrations occur in well WP-19 located near the northwest (up gradient) corner of the facility and down gradient of the Climax facility. Table 4 presents a summary of the general chemistry analytical results.

May 2010 Results

Chlorides – The following samples from the east lobe exhibited barium concentrations above the WQCC domestic water quality standard of 250 mg/L:

- WP-10 (1,010 mg/L)
- WP-11 (525 mg/L)
- WP-12 (725 mg/L)
- WP-14 (5,150 mg/L)
- WP-16 (380 mg/L)
- WP-18 (6,450 mg/L)
- WP-21 (3,410 mg/L)
- WP-22 (1,780 mg/L)
- WP-23 (6,730 mg/L)

Laboratory results from the west lobe reported chloride concentrations in excess of the 250 mg/L in the following samples:

- WP-05 (465 mg/L)
- WP-06 (495 mg/L)
- WP-07 (13,100 mg/L)
- WP-19 (20,300 mg/L)
- WP-20 (8,200 mg/L)

Sulfate – Laboratory results from the east lobe reported sulfate above the WQCC domestic water quality standard of 600 mg/L in the following samples:

- WP-14 (1,390 mg/L)
- WP-21 (1,220 mg/L)
- WP-22 (624 mg/L)
- WP-23 (1,110 mg/L)

Laboratory results from the west lobe reported sulfate above the WQCC domestic water quality standard of 600 mg/L in the following samples:

- WP-06 (951 mg/L)
- WP-07 (4,800 mg/L)
- WP-19 (3,460 mg/L)
- WP-20 (3,790 mg/L)

TDS – Analytical data from the east lobe exhibited TDS concentrations in excess of the WQCC domestic water quality standard of 1,000 mg/L in the following samples:

- WP-10 (2,900 mg/L)
- WP-11 (2,180 mg/L)
- WP-12 (2,980 mg/L)
- WP-13 (1,730 mg/L)
- WP-14 (11,790 mg/L)
- WP-16 (2,250 mg/L)
- WP-18 (13,900 mg/L)
- WP-21 (7,920 mg/L)

March 11, 2011

- WP-22 (4,370 mg/L)
- WP-23 (15,100 mg/L)

Analytical data from the west lobe exhibited TDS concentrations in excess of the WQCC domestic water quality standard of 1,000 mg/L in the following samples:

- WP-04R (1,220 mg/L)
- WP-05 (1,990 mg/L)
- WP-06 (3,030 mg/L)
- WP-07 (30,400 mg/L)
- WP-19 (40,700 mg/L)
- WP-20 (20,200 mg/L)

No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-14 and WP-17, therefore, no samples were collected during this event. Figure 5a and Figure 6a present concentration maps of observed chloride and TDS concentrations in groundwater samples for the May 2010 sampling event, respectively.

November 2010 Results

Chlorides – The following samples from the east lobe exhibited chloride concentrations above the WQCC domestic water quality standard of 250 mg/L:

- WP-10 (434 mg/L)
- WP-11 (444 mg/L)
- WP-12 (681 mg/L)
- WP-16 (424 mg/L)
- WP-17 (4,410 mg/L)
- WP-18 (7,500 mg/L)
- WP-21 (3,870 mg/L)
- WP-22 (1,630 mg/L)
- WP-23 (7,240 mg/L)

Laboratory results from the west lobe reported chloride concentrations in excess of the 250 mg/L in the following samples:

- WP-05 (274 mg/L)
- WP-06 (351 mg/L)
- WP-07 (6,910 mg/L)
- WP-19 (20,200 mg/L)
- WP-20 (8,920 mg/L)

Sulfates – The following samples from the east lobe exhibited sulfate concentrations above the WQCC domestic water quality standard of 600 mg/L:

- WP-21 (1,260 mg/L)
- WP-22 (774 mg/L)
- WP-23 (1,350 mg/L)

The following samples from the west lobe exhibited sulfate concentrations above the WQCC domestic water quality standard of 600 mg/L:

- WP-06 (1,960 mg/L)
- WP-07 (3,710 mg/L)
- WP-19 (5,500 mg/L)
- WP-20 (3,520 mg/L)

TDS – Analytical data from the east lobe exhibited TDS concentrations in excess of the WQCC domestic water quality standard of 1,000 mg/L in the following samples:

- WP-10 (2,140 mg/L)
- WP-11 (2,070 mg/L)
- WP-12 (3,000 mg/L)
- WP-13 (1,920 mg/L)
- WP-16 (2,430 mg/L)
- WP-17 (8,400 mg/L)
- WP-18 (14,700 mg/L)
- WP-21 (8,350 mg/L)
- WP-22 (4,060 mg/L)
- WP-23 (15,100 mg/L)

March 11, 2011

Analytical data from the west lobe exhibited TDS concentrations in excess of the WQCC domestic water quality standard of 1,000 mg/L in the following samples:

- WP-04 (1,070 mg/L)
- WP-04R (1,190 mg/L)
- WP-05 (1,740 mg/L)
- WP-06 (4,110 mg/L)
- WP-07 (17,700 mg/L)
- WP-19 (41,000 mg/L)
- WP-20 (20,500 mg/L)

No data quality exceptions were noted in the DHL case narratives. LNAPL was observed in wells WP-14 and WP-17, therefore, no samples were collected during this event. Figure 5b and 6b present concentration maps of observed chloride and TDS concentration for the November 2010 sampling event, respectively.

4.0 CONCLUSIONS

The following observations are documented in this report:

- Groundwater flow direction remains bifurcating to the south and southeast at a gradient of approximately 0.004 feet per foot
- WP-02 remained dry, as it has since September 20, 2007
- LNAPL consistent with natural gas condensate was detected in WP-14 (November 2010), WP-15 (March, May, September and November 2010), WP-17 and WP-18 (March 2010)
- No samples were collected from WP-15 (May and November 2010), WP-14 and WP-17 (May 2010) due to LNAPL in the wells
- Benzene and chloride remain as contaminants of concern and exceed the WQCC standards in most wells
- Barium is the only metal compound consistently observed in groundwater above the WQCC standard
- Hydrocarbon plume delineation has been achieved

5.0 Recommendations

No further investigation is needed since the dissolved phase hydrocarbon plume has been delineated. Targa proposes to conduct annual (once yearly) gauging and sampling for general water chemistry and BTEX. Laboratory analytical results will be maintained at the facility for inspection by the OCD. Product recovery will resume in wells showing recoverable LNAPL. Targa will notify the OCD at least 48 hours prior to the annual monitoring events, and as soon as possible to any significant change in analyte concentrations.

Notes

All values are in feet, unless otherwise noted.

TOC - top of casing

Elevations are referenced to 1984 Geodetic Datum.

LNAPL sheens are presented as 0.00 foot thickness

Notes

NMWQCC - New Mexico Water Quality Control Commission Human Health Standard
 Analyses after 1/2007 performed by DHL Analytical, Inc., Round Rock, Texas
 Results reported in milligrams/Liter (mg/L)
 ND - not detected
 < Less than method detection limit
 -- Product in well - no sample collected
