V. Scope of Work (previously approved 6/12/12)

Upon approval of this work plan and based on the enclosed analytical results, Yates Petroleum Corp. will start by moving in a track hoe so deeper delineation is achievable to 20'. Once full delineation of the affected area has been achieved, impacted soils will be taken to an NMOCD approved facility for disposal. If at 20' Yates Petroleum Corp. has not determined the bottom of the impacted material efforts will be reevaluated and an "Addendum of the Scope of Work" will be submitted.

Addendum to Scope of Work

Yates Petroleum Corp. will start by excavating the top 4' of impacted material and haul to an NMOCD approved facility for disposal. After this is completed the remaining 16' of impacted material will be spread out on plastic in no deeper than a 3' layer. Yates Petroleum will then start the process of working the material and adding water and fertilizer as needed to remediate the material so it can be returned to the excavation area at the time that sample levels are below RRAL's. Once the 16' of material has been returned to the excavation then 4' of new caliche will be placed on top to replace the original 4' that was disposed of.
