Geoffrey,

Thank you for speaking with me this morning. It has taken me a little bit to bring all of the information together, but I wanted to give you a good look at what I've looked to this point for evaluation of the Site. It appeared that dirt work for the initial response had been performed in areas where run-off or spray from the initial incident (lightning strike) had occurred. When comparing the Site to the guidance, I had initially ranked the Site a 10 since the saturated soil occurred at the tank battery that is over 200' from the dry creek bed, is over 100 feet to ground water, and according to the Dept of State Engineer website (link previously sent) is greater than 1000' from a water source. My determination of distance from a surface water body is somewhat conservative as the 1984 USGS topo map plots an 'intermittent stream', but I could not find that same term by definition of in the OCD rules. Please let me know if I am going in the right direction or if this assumption needs to be corrected.

I've attached several files to help illustrate the Site:

- Rock Lake 15 #001.kmz for google earth viewing of the soil sample locations
 - o SS-001, NW extent of dirt work from initial response
 - SS-002, just outside of tank battery fence in area where dirt work had been performed from the initial response
 - SS-003, Inside fence small area of saturated soil
 - o SS-004, 0-2" area of saturated soil inside berm
 - SS-005, 4-6" area of saturated soil inside berm (same location as SS-004)
 - SS-006, Soil from pile on plastic (dirt work from initial response)
 - SS-007, East of wellhead in area of dirt work from initial response
 - SS-008, Near dry drainage channel
- Rock Lake 15 #001 Topo Hybrid.kmz for google earth that has an historic aerial photo with topographic features superimposed onto it
- Rock Lake Topo.jpg that illustrates the 1984 topo with a rough outline of pad location (blue box)
- Sample analysis for the corresponding sample points (most TPH and Chloride sample results for samples were lo.

Top information:

State: New Mexico

Topo Map Source: Oil Center
Source Scale: 1:24000

Map Source Year: 1984

PLSS Township: T22.0S, R35.0E

Please give me a call when you have a chance to look at this information so I can better propose a plan for remediation.

Thank you,

Frank Engallina, IAC | Division Manager W&M ENVIRONMENTAL GROUP, INC.

RE: Remediation of Well Pad and Tank Battery – Rock Lake 15 #001

Dear Mr. Leking:

This letter report details remedial activities planned for BC Operating, Inc. (BC Operating) regarding the soil remediation of the well pad and tank battery, Rock Lake 15 #001, located west of Eunice, New Mexico (Site), by W&M Environmental Group, Inc. (W&M).

Introduction

The Rock Lake 15 #001 tank battery was struck by lightning during a storm event on or about October 14, 2013. The lightning strike resulted in a release of approximately 335 barrels of produced oil and water leaving an undetermined amount of petroleum impacted soil at the Site. The initial response resulted in the excavation of approximately 100 cubic yards (CY) of petroleum impacted soils, which is temporarily stockpiled on plastic sheeting at the Site.

On November 6, 2013, W&M visited the Site to document the incident. W&M collected 8 preliminary soil samples of the impacted area in order to determine the extent of the contamination and treatability potential of the impacted soil. The attached Figure 1 depicts the Site location as well as the locations of the 8 preliminary soil samples. Analytical data for the preliminary soil samples can be found in **Appendix A**.

Remediation Work Plan

Remediation activities will be performed in accordance with the New Mexico Oil Conservation Division (NMOCD) Guidelines for Remediation of Leaks, Spills and Releases, dated August 13, 1993. Pre-excavation activities will include the removal and on-Site staging of production equipment located within the tank battery, and the delineation of impacted soil. Delineation of impacted soils will be accomplished by trenching/potholing with a backhoe to determine the vertical and horizontal extents of contamination within the tank battery. Soil samples for Total Petroleum Hydrocarbons

AUSTIN

HOUSTON

SAN ANTONIO

PLANO

(TPH) and Chlorides will be collected at depth in 1 foot intervals and sent to a fixed, independent, environmental laboratory for analysis. Based on the preliminary investigation, an estimated 1,100 CY (excavated) will be removed from the Site. Impacted soil will be removed from the ground inside and around the tank battery foot print until either 1,100 manifested CY are removed or a representative sample from the walls and bottoms of the excavation are reported below the specific remediation levels appropriate for the Site. If concentrations exceeding the recommended remedial action levels prescribed by the NMOCD guidance remain in the soil at the 1,100 CY threshold, W&M will temporarily suspend excavation activities until approval of additional excavation is approved by BC Operating.

Due to the irregular pattern and anticipated depth of contamination at the Site, up to 32 confirmation samples for TPH and Chlorides will be taken and analyzed on a 2-day turnaround time (TAT). Impacted soil will be excavated and transported to the Sundance Services, Inc. soil recycling facility in Eunice, New Mexico to be disposed of as Oil and Gas Waste. Soil sampling for headspace analysis will be conducted during excavation activities as a screening tool and in lieu of laboratory analysis for benzene and BTEX using a Photo-Ionization Detector (PID) to determine the total volatile organic vapor concentrations and extent of impacted soils.

Upon completion of required remedial actions, the Site will be closed by backfilling the excavated areas with clean imported fill material (soil/caliche) and compacted in lifts by excavator pressure and contoured to resemble the existing drainage patterns. Where necessary, the Site will then be seeded with an approved Bureau of Land Management (BLM) mix for re-vegetation purposes before the next growing season.

If you have any questions, please contact Frank Engallina at 210-319-5116.

Sincerely,

W&M ENVIRONMENTAL GROUP, INC.

Frank Engallina Division Manager

Frank S. Englis IV

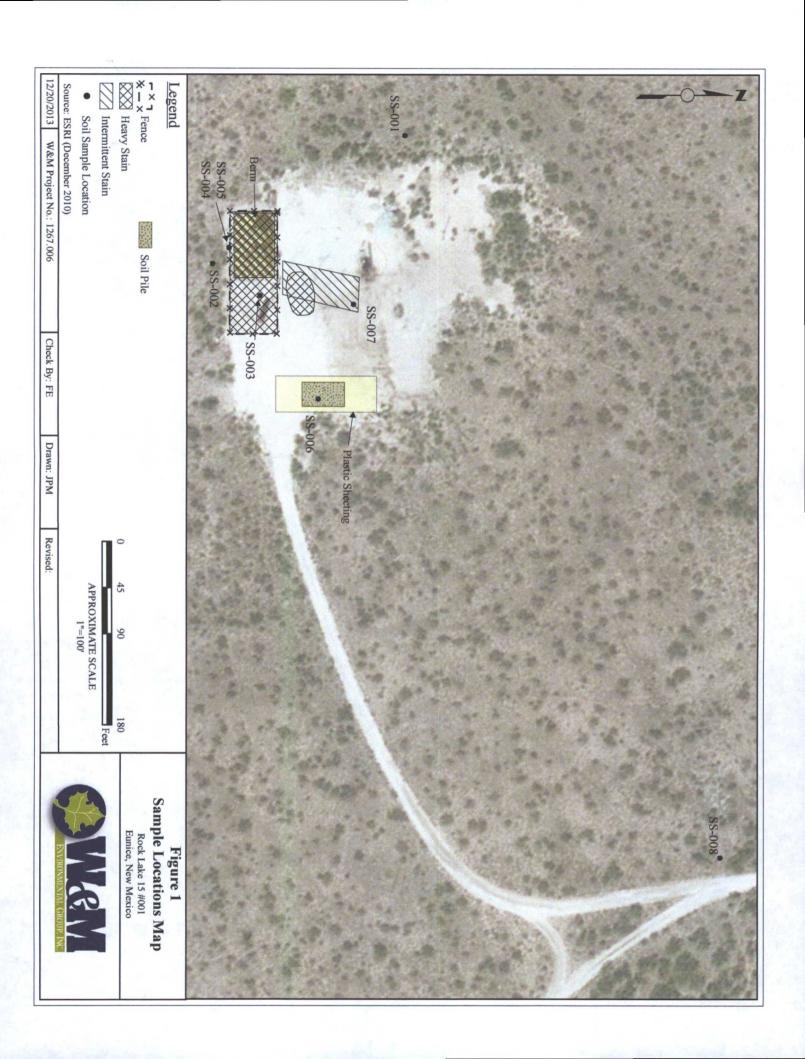

TABLE 1 SUMMARY OF SOIL ANALYTICAL RESULTS

BC Operating Rock Lake 15 #001 Eunice, New Mexico

Sample Name	TPH (mg/kg)	Chlorides (mg/kg)	Depth
SS-001	3.7	43	0-2 in.
SS-002	14,500	3,700	0-2 in.
SS-003	28,700	200	0-2 in.
SS-004	23,000	1700	0-2 in.
SS-005	257	1700	4-6 in.
SS-006	2,380.99	100	0-2 in.
SS-007	22,100	1400	0-2 in.
SS-008	3.2	140	0-2 in.

Notes:

¹Samples collected by W&M and analyzed by ESC Lab Sciences in Mt. Juliet, TN.

²TPH is calculated by adding the analytical results for TPH Low Fraction (BTEX) and DRO.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

Qualifier Report Information

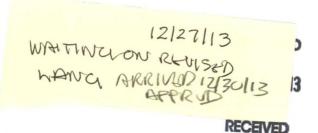

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Mr. Geoffrey Leking New Mexico Oil Conservation Division 1625 N. French Drive Hobbs, New Mexico 88240

RE: Remediation of Well Pad and Tank Battery – Rock Lake 15 #001

Dear Mr. Leking:

This letter report details remedial activities planned for BC Operating, Inc. (BC Operating) regarding the remediation of the well pad and tank battery, Rock Lake 15 #001, located west of Eunice, New Mexico, by W&M Environmental Group, Inc. (W&M).

Introduction

The Rock Lake 15 #001 tank battery was struck by lightning during a storm event on or about October 14, 2013. The lightning strike resulted in a release of approximately 335 barrels of produced oil and water leaving an undetermined amount of petroleum impacted soil at the Site. The initial response resulted in the excavation of approximately 100 cubic yards (CY) of petroleum impacted soils, which is temporarily stockpiled on plastic sheeting at the Site.

On November 6, 2013, W&M visited the Site to document the incident. W&M collected 8 preliminary soil samples of the impacted area in order to determine the extent of the contamination and treatability potential of the impacted soil. The attached Figure 1 depicts the Site location as well as the locations of the 8 preliminary soil samples. Analytical data for the preliminary soil samples can be found in **Appendix A**.

Remediation Work Plan

Pre-excavation activities will include the removal and on-Site staging of production equipment located within the tank battery, and the delineation of impacted soil. Delineation of impacted soils will be accomplished by trenching/potholing with a backhoe to determine the vertical and horizontal extents of contamination within the tank battery. Soil samples for Total Petroleum Hydrocarbons (TPH) and Chlorides will be taken at depth in 1 foot intervals and sent to a fixed laboratory for analysis. An estimated 1,100 CY will be removed from the Site. Impacted soil will be removed from the ground inside and

FORT WORTH PLANO **AUSTIN** HOUSTON **SAN ANTONIO**

around the tank battery foot print until either 1,100 manifested CY are removed or a representative sample from the walls and bottoms of the excavation are reported below the specific remediation levels appropriate for the Site.

Due to the irregular pattern and anticipated depth of contamination at the Site, up to 32 confirmation samples for TPH and Chlorides will be take and analyzed on a 2-day TAT. Impacted soil will be excavated and transported to the Sundance Services, Inc. soil recycling facility in Eunice, New Mexico to be disposed of as Oil and Gas Waste. Soil sampling for headspace analysis will be conducted during excavation activities as a screening tool and in lieu of laboratory analysis for benzene and BTEX using a Photo-Ionization Detector (PID) to determine the total volatile organic vapor concentrations and extent of impacted soils.

Upon completion of required remedial actions, the Site will be closed by backfilling the excavated areas with clean imported fill material (soil/caliche) and compacted in lifts by excavator pressure and contoured to resemble the existing drainage patterns. Where necessary, the Site will then be seeded with an approved Bureau of Land Management (BLM) mix for re-vegetation purposes before the next growing season.

If you have any questions, please contact Frank Engallina at 210-319-5116.

Sincerely,

W&M ENVIRONMENTAL GROUP, INC.

Frank S. Englis IV

RE: Remediation Work Plan Addendum - Rock Lake 15 #001

Dear Mr. Leking:

This letter report details additional remedial activities planned for BC Operating, Inc. (BC Operating) regarding the soil remediation of the well pad and tank battery, Rock Lake 15 #001, located west of Eunice, New Mexico (Site), by W&M Environmental Group, Inc. (W&M).

Introduction

The Rock Lake 15 #001 tank battery was struck by lightning during a storm event on or about October 14, 2013. The lightning strike resulted in a release of approximately 335 barrels of produced oil and water leaving an undetermined amount of petroleum impacted soil at the Site. To date, remediation activities have resulted in the excavation and disposal of approximately 1,200 cubic yards (CY) of petroleum impacted soils, leaving an excavated area that is approximately 100 feet by 75 feet and 3.5 feet deep.

On March 12, 2014, W&M conducted additional delineation sampling at the Site. Based on the soil analytical data collected from the side walls and floor of the the initial excavation, chloride impacted soil remains at the Site above the recommended remedial action level (RRAL) of 1,000 mg/kg. The attached Figure 6 depicts the locations of these soil samples. Analytical data for the delineation soil samples can be found in **Appendix A**.

Remediation Work Plan

Additional remediation activities are scheduled for March 8, 2014 and will be performed in accordance with the New Mexico Oil Conservation Division (NMOCD) Guidelines for Remediation of Leaks, Spills and Releases, dated August 13, 1993 and at the direction of NMOCD District 1 personnel for the removal of chloride impacted soil at the Site as discussed in telephone conversations and e-mail communication on March 28, 2014.

AUSTIN

FORT WORTH

HOUSTON

SAN ANTONIO

PLANO

Approximately 600 CY of additional chloride impacted soil will be removed from the Site. The excavation will be widened on the north, south, east and west walls, and the entire excavation will be overexcavated to 4 feet below grade. Soil confirmation samples will be collected from the sidewalls of the excavation and sent to an indepented fixed laboratory for analysis of chloride by EPA method 9056. Based on the confirmation sample results and chloride remediation effectiveness, additional soil will be removed, if necessary, or a 20 mil. poly liner will be installed and anchored by trenching and burying the liner inside the perimeter of the excavation in preparation for backfill activities.

Upon completion of required remedial actions, the Site will be closed by backfilling the excavated areas with clean imported fill material (soil/caliche) and compacted in lifts by excavator pressure and contoured to resemble the existing drainage patterns. Where necessary, the Site will then be seeded with an approved Bureau of Land Management (BLM) mix for re-vegetation purposes.

If you have any questions, please contact Frank Engallina at 210-319-5116.

Sincerely,

W&M ENVIRONMENTAL GROUP, INC.

Frank Engallina Division Manager

Attachment A List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L687674-09	WG710720	SAMP	Chloride	R2893303	J5J6J3

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
 - Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

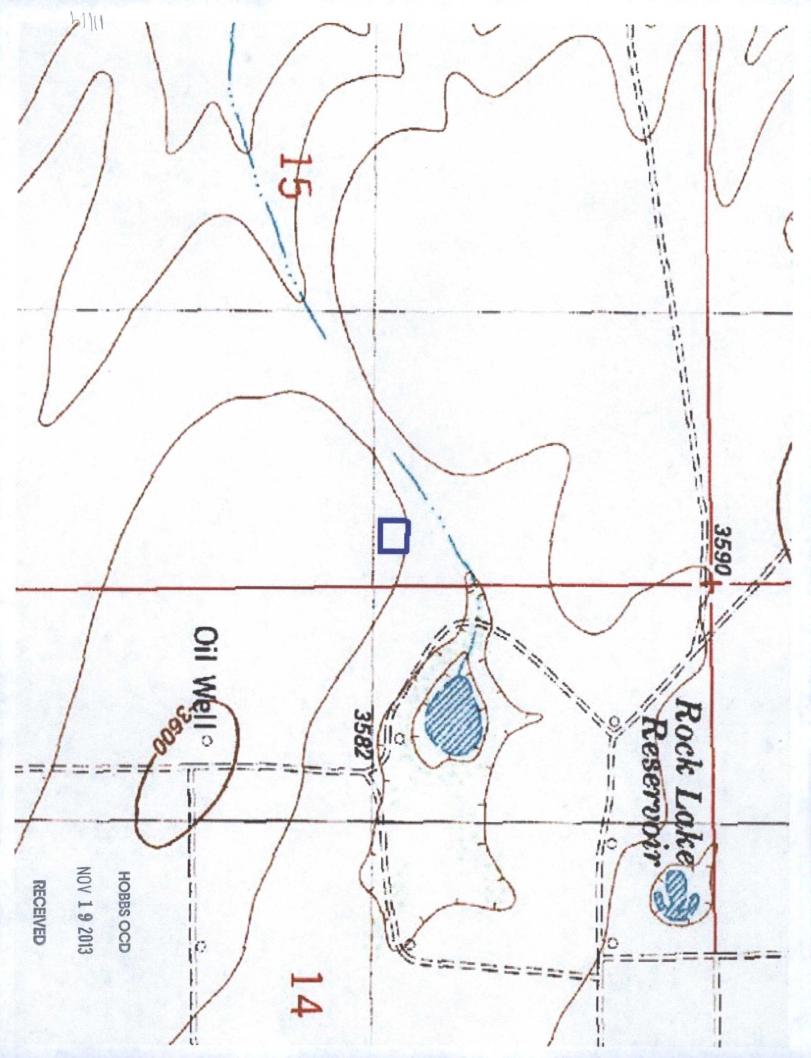

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods,it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Figure 6 1267.006.pdf

Geoff,

Please find the attached sample location map. The last round of samples was taken based on the results of the previous round of sampling as follows:

- SS-022 Taken outside of excavation approximately 2' to the east, previous (SS-016, sidewall, Chloride at 1,600 mg/kg)
- SS-023 Taken outside of excavation approximately 2' to the south, previous (SS-017, sidewall, Chloride at 1,200 mg/kg), refusal with track hoe at 10' bgs (very hard rock)
- SS-024 Taken outside of excavation approximately 2' to the west, previous (SS-018, sidewall, Chloride at 1,200 mg/kg)
- SS-025 Taken inside of excavation approximately 2' south of previous (SS-015, sidewall, Chloride at 130 mg/kg)
- SS-026 Taken in center of excavation floor.

Please call me to discuss, this afternoon or Monday.

Thank you,

Frank Engallina

Subject: BC Operating Rock Lake 15 #001- Additional Delineation Results and Request for C-141 Extension

Geoff.

W&M conducted delineation sampling last week at the Rock Lake Site. The attached lab report provides the results of this sampling event. I would like to talk to you about remedial action moving forward so I can better scope this work and present cost to completion to the client.

I also need to request an extension of the C-141 to continue the remedial action and gain closure on this Site.

Will you be available for discussion tomorrow morning or is another time better for you?

Thank you,

Frank Engallina

The chloride RRALs are similar not only to the old pit rule values but also to the values stated in the <u>current</u> surface waste management facilities rules of 19.15.36 NMAC. See 19.15.36.15.A., 19.15.36.16.b.(2), c. and E.(1)(d).

Subject: RE: BC Operating Rock Lake 15 #001 Closure Report

Geoff,

During Work Plan development, I was told (over phone) to use 1,000 mg/kg as the RRAL for Chlorides per the Pit Rules as Chlorides are not listed as a contaminant of concern in the spill cleanup guidance. I questioned this RRAL because the current Pit Rule lists 20,000 mg/kg for Chlorides and was told at that time to follow the Old Pit Rules. Can you provide further direction that I can share with the client? They're position is that if we are using the Pit Rule for guidance, then the current Pit Rule should be followed not the old.

Thank you,

Frank Engallina

Frank

The recommended remedial action level (RRAL) is 1000 ppm for chlorides where ground water is at a depth equal to or greater than 100'. In addition, delineation of chlorides to 250 ppm or the display of a decreasing trend with depth of chloride concentration that assures that chlorides do not reach the ground water table at or above 250 ppm is required.

See attachment.

Thank you.

Geoff,

Attached is an electronic copy of the BC Operating Rock Lake 15 #001 Closure Report, dated February 12, 2014. BC Operating would like to close the Site to rebuild the tank battery and bring the well back online as soon as possible. Please do not hesitate to contact me with any questions, comments or concerns regarding this report.

Thank you for your continued support on this project.

RE: Final Closure Report - Order No. 2982

Rock Lake 15 #001, Well Pad and Tank Battery Remediation

Eunice, New Mexico

W&M Project No. 1267.006

Dear Mr. Leking:

W&M Environmental Group, Inc. (W&M) performed a limited Environmental Site Assessment (ESA) and remediation activities at the BC Operating, Inc. (BC Operating) Rock Lake 15 #001well pad and tank battery, located west of Eunice, New Mexico (Site). The location of the Site is presented in Figure 1. Assessment activities consisted of collecting soil samples in the affected area to determine the nature and extent of the affected area. Remediation activities consisted of excavating impacted soil from the affected area, collecting confirmation samples, and disposal of the excavated material at a soil recycling facility as oilfield exempt waste.

BACKGROUND

The Rock Lake 15 #001 tank battery was struck by lightning during a storm event on or about October 14, 2013. The lightning strike resulted in a release of approximately 335 barrels of produced oil and water leaving an undetermined amount of petroleum impacted soil at the Site. A Release Notification and Corrective Action Form C-141 was submitted to the New Mexico Oil Conservation Division (NMOCD) on October 16, 2013. Initial response activities included the removal of surface soils outside the fenced area of the tank battery. This effort produced approximately 100 cubic yards (CY) of petroleum impacted soils that were temporarily stockpiled on plastic sheeting at the Site.

DETERMINATION OF REMEDIATION ACTION LEVELS

Remediation action levels for the Site were determined following the NMOCD, *Guidelines for Remediation of Leaks, Spills and Releases*, dated August 13, 1993. The guidelines set forth by the NMOCD classify sites by three ranking criteria: depth to groundwater, wellhead protection area, and distance to surface water body. The Site was determined to have a total ranking score of zero based on these criteria.

AUSTIN FORT WORTH HOUSTON SAN ANTONIO PLANO

Mr. Geoffrey Leking February 12, 2014 Page 2

Potential chemicals of concern (COCs) are identified in the NMOCD Guidelines for Remediation of Leaks, Spills and Releases, dated August 13, 1993 and the NMOCD Pit Rule, New Mexico Administrative Code (NMAC) 19.15.17, dated June 6, 2013. COCs included benzene, toluene, ethylbenzene, and xylene (BTEX) using U.S. Environmental Protection Agency (EPA) Method 8021; total petroleum hydrocarbons (TPH) using EPA Method 8015; and chloride using EPA method 9056. According to Section IV.A.2.b of the NMOCD guidance, "A field soil vapor headspace measurement (Section V.B.1) of 100 ppm may be substituted for a laboratory analysis of the Benzene and BTEX concentration limits." W&M elected to analyze all soil samples for BTEX as confirmation of and in conjunction with the use of field soil vapor headspace measurements. Field soil vapor headspace measurements were used as the determining screening tool in the field for confirmation sampling of the final excavation. As such, sample results for BTEX are documented in the laboratory reports (Attachment A), but are not summarized in the data tables. Furthermore, BTEX was not detected in any of the excavation confirmation samples.

LIMITED SITE ASSESSMENT - SOIL INVESTIGATION

On November 6, 2013, W&M visited the Site to document the incident. W&M collected eight preliminary surface soil samples of the impacted area in and around the tank battery in order to determine the extent of the impact, treatability potential of the impacted soil, and to evaluate the effectiveness of the initial response. Soil samples were placed in laboratory-supplied glass jars, stored on ice, and submitted to ESC Lab Sciences (ESC) in Mt. Juliet, Tennessee, under chain of custody for analysis. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056.

Sample analyses of the surface soil samples identified concentrations of TPH above the remediation action level of 5,000 mg/kg in soil samples SS-002, SS-003, SS-004, and SS-007. Each chloride sample was detected at a concentration below the NMOCD Pit Rule limit of 20,000 mg/kg. Figure 2 depicts the impacted areas that were observed at the Site, and the locations of the eight preliminary surface soil samples. Analytical results for the soil samples are summarized in **Table 1** and copies of laboratory analytical data packages are presented in **Attachment A**.

W&M continued assessment activities on January 6, 2014, to delineate impacted soil at the Site by trenching with a backhoe to determine the vertical and horizontal extents of impact within the tank battery. Soil samples SS-009 through SS-013 were collected in 1 foot intervals to a total depth of 3 feet below grade. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 8056.

Sample concentrations for TPH were less than the action level (5,000 mg/kg) and ranged from less than the sample detection limit (SDL) to 2,970 mg/kg (SS-010, 2 feet). Sample concentrations for chloride were less than the action level (20,000 mg/kg) and ranged from 240 mg/kg (SS-013, 1 foot) to 4,600 mg/kg (SS-010, 2 feet). Delineation soil sample locations are depicted on **Figure 3** and analytical results are summarized in **Table 2**.

Mr. Geoffrey Leking February 12, 2014 Page 3

REMEDIATION - SOIL EXCAVATION

Remediation activities were initiated on January 6, 2014, after trench sampling was completed, and included the removal and on-Site staging of production equipment located within the tank battery. The excavation was designed to remove TPH-impacted soil in and around the tank battery. Saturated soils were removed first, per NMOCD guidance, and stockpiled on plastic sheeting while awaiting transport to Sundance Services, Inc., a soil recycling facility in Eunice, New Mexico.

The remaining unsaturated soils were then removed and soil vapor headspace measurements were collected in the sidewalls and bottom of the excavation using a Photo-Ionization Detector (PID). Excavation activities were advanced until soil vapor headspace measurements were reported below the NMOCD recommended concentration limit of 100 parts per million (ppm) for volatile organic compounds (VOCs). Confirmation soil samples SS-015 N through SS-019 F were collected from the four sidewalls and floor of the excavation. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056. Sample concentrations for BTEX were below the sample detection limits (SDL) and remediation action levels. Concentrations for TPH were less than the action level (5,000 mg/kg) and ranged from less than the SDL to 270 mg/kg (SS-018 W, 2 feet). Sample concentrations for chloride were less than the action level (20,000 mg/kg) and ranged from 130 mg/kg (SS-015N, 2 foot) to 4,700 mg/kg (SS-019 F, 3.5 feet). Confirmation soil sample locations are depicted on Figure 4 and analytical results are summarized in Table 3.

Excavation activities continued with the removal of shallow surface soils (less than 1 foot below grade). For this effort, soils were removed in areas where intermittent staining was observed in association with historic Site operations on the north side of the tank battery and around the wellhead.

Additional vertical delineation samples were collected in the floor of the excavation on January 14, 2014. Samples were collected at depth in 1 foot intervals from 4.5 feet to 8.5 feet below grade. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056. Samples concentrations for BTEX were below the SDL. Concentrations for TPH were less than the action level of (5,000 mg/kg) and ranged from less that the SDL to 39.1 mg/kg (SS-021, 4.5). Sample concentrations for chloride were less that the action level (20,000 mg/kg) and ranged from 3,900 mg/kg (SS-021, 7.5 feet) to 6,100 mg/kg (SS-021, 4.5 feet). The additional vertical delineation sample locations are illustrated on **Figure 5** and analytical results are summarized in **Table 4**.

Soil disposal and staging of clean backfill materials were complete on January 14, 2014. Approximately 1,268 CY of contaminated soil were transported to Sundance Services, Inc. soil recycling facility. A copy of the waste load tickets are provided in **Attachment B**. A sample of the caliche backfill was collected for laboratory analysis of chloride. The soil sample was sent under chain of custody to ESC for analysis of chloride using EPA method 8056. Concentration for chloride was 300 mg/kg, below the NMOCD recommended level for clean fill of 600 mg/kg. Sample location is shown on **Figure 5** and analytical data is included in the summarized data in **Table 4**.

Mr. Geoffrey Leking February 12, 2014 Page 4

CONCLUSIONS AND RECOMMENDATIONS

Impacted soil has been removed to below the NMOCD remediation action levels for the identified COCs at the Site. Based on the results of the soil confirmation samples, W&M, on behalf of BC Operating, requests the issuance of a closure approval letter for this remedial action. BC Operating has requested that the Site be closed within 21 days of the date of this report to re-build the tank battery and bring the well back online. The Site will be closed by backfilling the excavated areas with clean imported fill material (soil/caliche) and compacting in lifts by excavator pressure and contoured to resemble the existing drainage patterns. Where necessary, the Site will then be seeded with an approved Bureau of Land Management (BLM) mix for re-vegetation purposes before the next growing season.

If you have any questions or need additional information, please contact Frank Engallina at 210-319-5116.

Very Truly Yours,

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to $^{\prime\prime\prime}$ dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions Accuracy - The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.

- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Difference.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning	
J5	The sample matrix interfered with the ability to make any accurate determination: spike value is high	

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods,it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment A List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L678212-01	WG701672	SAMP	C28-C40 Oil Range	R2877124	J

Attachment B Explanation of QC Qualifier Codes

Qualifier Meaning

J

(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment A List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L687674-09	WG710720	SAMP	Chloride	R2893303	J5J6J3

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

RE:

Final Closure Report, Addendum 1 – Order No. 2982

Rock Lake 15 #001, Well Pad and Tank Battery Remediation

Eunice, New Mexico

W&M Project No. 1267.006

Dear Mr. Leking:

W&M Environmental Group, Inc. (W&M) performed a limited Environmental Site Assessment (ESA) and remediation activities at the BC Operating, Inc. (BC Operating) Rock Lake 15 #001well pad and tank battery, located west of Eunice, New Mexico (Site). The location of the Site is presented in Figure 1. Assessment activities consisted of collecting soil samples in the affected area to determine the nature and extent of the affected area. Remediation activities consisted of excavating impacted soil from the affected area, collecting confirmation samples, and disposal of the excavated material at a soil recycling facility as oilfield exempt waste. This Final Closure Report documents Phases I and II of the remediation activities and documents the removal of impacted soil exceeding the New Mexico Oil Conservation Division (NMOCD) recommended remedial action level (RRAL) for the identified chemicals of concern (COCs) at the Site.

BACKGROUND

The Rock Lake 15 #001 tank battery was struck by lightning during a storm event on or about October 14, 2013. The lightning strike resulted in a release of approximately 335 barrels of produced oil and water leaving an undetermined amount of petroleum impacted soil at the Site. A Release Notification and Corrective Action Form C-141 was submitted to the NMOCD on October 16, 2013. Initial response activities included the removal of surface soils outside the fenced area of the tank battery. This effort produced approximately 100 cubic yards (CY) of petroleum impacted soils that were temporarily stockpiled on plastic sheeting at the Site.

DETERMINATION OF REMEDIATION ACTION LEVELS

Remediation action levels for the Site were determined following the NMOCD, *Guidelines for Remediation of Leaks*, *Spills and Releases*, dated August 13, 1993. The guidelines set forth by the NMOCD classify sites by three ranking criteria: depth to groundwater, wellhead protection area, and

AUSTIN FORT WORTH HOUSTON SAN ANTONIO PLANO

distance to surface water body. The Site was determined to have a total ranking score of zero based on these criteria. Potential COCs are identified in the NMOCD Guidelines for Remediation of Leaks, Spills and Releases, dated August 13, 1993 and the NMOCD Pit Rule, New Mexico Administrative Code (NMAC) 19.15.17, dated June 6, 2013. COCs included benzene, toluene, ethylbenzene, and xylene (BTEX) using U.S. Environmental Protection Agency (EPA) Method 8021; total petroleum hydrocarbons (TPH) using EPA Method 8015; and chloride using EPA method 9056. According to Section IV.A.2.b of the NMOCD guidance, "A field soil vapor headspace measurement (Section V.B.1) of 100 ppm may be substituted for a laboratory analysis of the Benzene and BTEX concentration limits." W&M elected to analyze all soil samples for BTEX as confirmation of and in conjunction with the use of field soil vapor headspace measurements. Field soil vapor headspace measurements were used as the determining screening tool in the field for confirmation sampling of the final excavation. As such, sample results for BTEX are documented in the laboratory reports (Attachment A), but are not summarized in the data tables. Furthermore, BTEX was not detected in any of the excavation confirmation samples.

W&M submitted a Final Closure Report dated February 12, 2014 to the NMOCD at the end of what is now Phase I of remediation activities. Closure was denied by the NMOCD and W&M was directed to follow the more stringent recommended remedial action level (RRAL) for chloride in soil of 1,000 mg/kg per the previous NMOCD Pit Rule and current Surface Waste Management Facilities Rules, NMAC 19.15.36. This change in scope triggered Phase II remediation activities to remove chloride contaminated soils laterally below the RRAL and to demonstrate a reduction in chlorides to the satisfaction of the NMOCD.

LIMITED SITE ASSESSMENT - SOIL INVESTIGATION

On November 6, 2013, W&M visited the Site to document the incident. W&M collected eight preliminary surface soil samples of the impacted area in and around the tank battery in order to determine the extent of the impact, treatability potential of the impacted soil, and to evaluate the effectiveness of the initial response. Soil samples were placed in laboratory-supplied glass jars, stored on ice, and submitted to ESC Lab Sciences (ESC) in Mt. Juliet, Tennessee, under chain of custody for analysis. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056.

Sample analyses of the surface soil samples identified concentrations of TPH above the remediation action level of 5,000 mg/kg in soil samples SS-002, SS-003, SS-004, and SS-007. Each chloride sample was detected at a concentration below the NMOCD Pit Rule limit of 20,000 mg/kg. Figure 2 depicts the impacted areas that were observed at the Site, and the locations of the eight preliminary surface soil samples. Analytical results for the soil samples are summarized in Table 1 and copies of laboratory analytical data packages are presented in Attachment A.

W&M continued assessment activities on January 6, 2014, to delineate impacted soil at the Site by trenching with a backhoe to determine the vertical and horizontal extents of impact within the tank battery. Soil samples SS-009 through SS-013 were collected in 1 foot intervals to a total depth of 3 feet below grade. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056.

Sample concentrations for TPH were less than the action level (5,000 mg/kg) and ranged from less than the sample detection limit (SDL) to 2,970 mg/kg (SS-010, 2 feet). Sample concentrations for chloride were less than the action level (20,000 mg/kg) and ranged from 240 mg/kg (SS-013, 1 foot) to 4,600

mg/kg (SS-010, 2 feet). Delineation soil sample locations are depicted on **Figure 3** and analytical results are summarized in **Table 2**.

REMEDIATION - SOIL EXCAVATION

Phase I

Remediation activities were initiated on January 6, 2014, after trench sampling was completed, and included the removal and on-Site staging of production equipment located within the tank battery. The excavation was designed to remove TPH-impacted soil in and around the tank battery. Saturated soils were removed first, per NMOCD guidance, and stockpiled on plastic sheeting while awaiting transport to Sundance Services, Inc., a soil recycling facility in Eunice, New Mexico.

The remaining unsaturated soils were then removed and soil vapor headspace measurements were collected in the sidewalls and bottom of the excavation using a Photo-Ionization Detector (PID). Excavation activities were advanced until soil vapor headspace measurements were reported below the NMOCD recommended concentration limit of 100 parts per million (ppm) for volatile organic compounds (VOCs). Confirmation soil samples SS-015 N through SS-019 E were collected from the four sidewalls and floor of the excavation. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056. Sample concentrations for BTEX were below the sample detection limits (SDL) and remediation action levels. Concentrations for TPH were less than the action level (5,000 mg/kg) and ranged from less than the SDL to 270 mg/kg (SS-018 W, 2 feet). Sample concentrations for chloride were less than the action level (20,000 mg/kg) and ranged from 130 mg/kg (SS-015N, 2 feet) to 4,700 mg/kg (SS-019 F, 3.5 feet). Confirmation soil sample locations are depicted on Figure 4 and analytical results are summarized in Table 3.

Excavation activities continued with the removal of shallow surface soils (less than 1 foot below grade). For this effort, soils were removed in areas where intermittent staining was observed in association with historic Site operations on the north side of the tank battery and around the wellhead.

Additional vertical delineation samples were collected in the floor of the excavation on January 14, 2014. Samples were collected at depth in 1 foot intervals from 4.5 feet to 8.5 feet below grade. The soil samples were sent under chain of custody to ESC for analysis of BTEX using EPA method 8021, TPH using EPA method 8015, and chloride using EPA method 9056. Samples concentrations for BTEX were below the SDL. Concentrations for TPH were less than the action level of (5,000 mg/kg) and ranged from less that the SDL to 39.1 mg/kg (SS-021, 4.5 feet). Sample concentrations for chloride were less that the action level (20,000 mg/kg) and ranged from 3,900 mg/kg (SS-021, 7.5 feet) to 6,100 mg/kg (SS-021, 4.5 feet). The additional vertical delineation sample locations are illustrated on Figure 5 and analytical results are summarized in Table 4.

Soil disposal and staging of clean backfill materials were completed on January 14, 2014. Approximately 1,268 CY of contaminated soil were transported to Sundance Services, Inc. soil recycling facility. A copy of the waste load tickets are provided in **Attachment B**. A sample of the caliche backfill was collected for laboratory analysis of chloride. The soil sample was sent under chain of custody to ESC for analysis of chloride using EPA method 9056. Concentration for chloride was 300 mg/kg, below the NMOCD recommended level for clean fill of 600 mg/kg. Sample location is shown on **Figure 5** and analytical data is included in the summarized data in **Table 4**.

Phase II

At the request of the NMOCD, W&M conducted additional delineation sampling for chloride on March 12, 2014. Soil samples were collected at four foot intervals approximately 2 feet outside of the north, south, east, and west perimeter of the excavation and in the floor of the excavataion. Soil analytical data collected to the east (SS-022), west (SS-024), north (SS-025) and in the floor (SS-026) of the excavation, revealed chloride impacted soil above the RRAL of 1,000 mg/kg at four feet, with reducing concentrations at depth. Analytical data collected outside south wall of the excavation (SS-023) were below the RRAL The attached **Figure 6** depicts the locations of these soil samples. Analytical data for the delineation soil samples can be found in **Table 5**.

Based on the soil analytical data produced from the sampling activities on March 12, 2014, additional excavation activities were conducted in order to remove the remaining chloride impacted soil at the Site which extended the footprint of the excavation to the north, south, east and west. Confirmation samples collected on April 8, 2014, revealed chloride concentrations of 390 mg/kg (SS-027, 2 feet), 1,600 mg/kg (SS-028, 2 feet), and 190 mg/kg (SS-029, 2 feet). The soil samples were sent under chain of custody to ESC for analysis of chloride using EPA method 9056. Based on analytical results, SS-027 collected from the east wall of the excavation, and SS-029 collected from the north wall of the excavation were below the RRAL for chloride. Soil sample SS-028 collected form the west wall of the excavation was above the RRAL. Based on the analytical results, additional chloride impacted soil was removed from the west wall. Analytical data for the final confirmation soil samples can be found in **Table 5**.

Excavation of chloride impacted soil continued on the west wall in attempt to remove the remaining chloride contaminated soil in this area. The following soil sample (SS-030, 2 feet) was collected on April 11, 2014 and revealed a chloride concentration of 1,300 mg/kg. Excavation activities continued on the west wall extending the footprint of the excavation 10 feet to the west. On April 15, 2014 soil samples (SS-031, SS-032, and SS-033) were collected at a depth of two feet by stepping out from the excavation in 10 foot increments to the west and sent under chain of custody to ESC for analysis of chloride using EPA method 9056. Soil analytical results for SS-031 revealed chloride concentration of 1,000 mg/kg.

On April 17, 2014 an additional two feet of soil was removed from the west wall of the excavation, and confirmation soil sample SS-034 was collected in the side west side wall of the excavation at 2 feet below grade and sent under chain of custody to ESC for analysis of chloride using EPA method 9056. Soil analytical results revealed chloride concentrations of chlorides at 360 mg/kg below the NMOCD RRAL. The attached Figure 7 depicts the locations of these soil samples. Analytical data for the final delineation and confirmation soil samples can be found in Table 6. Additionally, the entire excavated area was taken to four feet below grade.

Soil disposal and staging of clean backfill materials were completed on January 18, 2014. Approximately 882 CY of contaminated soil were transported to Sundance Services, Inc. soil recycling facility during Phase II remediation activities. A total of 2,150 CY of contaminated soil were removed and transported for off Site recycling in the completion of this project. A copy of the waste load tickets are provided in **Attachment B**.

SITE CLOSURE

Site closure activities were initiated on April 18, 2014. At the direction of NMOCD a 20 mil. poly liner was ordered to size and installed in the bottom of the excavation by digging a 1 foot trench around the interior perimeter of the excavation in order to anchor and cap the remaining chloride impacted soil. The excavation was then backfilled with the previously mentioned "clean" imported fill material (caliche) and was compacted in lifts by excavator pressure and contoured to resemble existing drainage patterns.

Where necessary, the Site was then seeded with an approved Bureau of Land Management (BLM) mix for re-vegetation purposes. Site closure was completed on May 9, 2014.

CONCLUSIONS AND RECOMMENDATIONS

Impacted soil has been removed to below the NMOCD RRAL for the identified COCs at the Site. Based on the results of the soil confirmation samples, W&M, on behalf of BC Operating, requests the issuance of a closure approval letter for this remedial action.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning	
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.	
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.	

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J	(EPA) - Estimated value below the lowest calibration point. Confidence correlates with concentration.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by

 Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Qualifier

Meaning

J5

The sample matrix interfered with the ability to make any accurate determination; spike value is high

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Difference.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment A List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier	
L678212-01	WG701672	SAMP	C28-C40 Oil Range	R2877124	J	

Attachment B Explanation of QC Qualifier Codes

Qualifier

Meaning

J

 $(\mbox{\sc EpA})$ - Estimated value below the lowest calibration point. Confidence correlates with concentration.

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.

Attachment A List of Analytes with QC Qualifiers

Sample Number	Work Group	Sample Type	Analyte	Run ID	Qualifier
L687674-09	WG710720	SAMP	Chloride	R2893303	J5J6J3

Attachment B Explanation of QC Qualifier Codes

Qualifier	Meaning
J3	The associated batch QC was outside the established quality control range for precision.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low

Qualifier Report Information

ESC utilizes sample and result qualifiers as set forth by the EPA Contract Laboratory Program and as required by most certifying bodies including NELAC. In addition to the EPA qualifiers adopted by ESC, we have implemented ESC qualifiers to provide more information pertaining to our analytical results. Each qualifier is designated in the qualifier explanation as either EPA or ESC. Data qualifiers are intended to provide the ESC client with more detailed information concerning the potential bias of reported data. Because of the wide range of constituents and variety of matrices incorporated by most EPA methods, it is common for some compounds to fall outside of established ranges. These exceptions are evaluated and all reported data is valid and useable "unless qualified as 'R' (Rejected)."

Definitions

- Accuracy The relationship of the observed value of a known sample to the true value of a known sample. Represented by percent recovery and relevant to samples such as: control samples, matrix spike recoveries, surrogate recoveries, etc.
- Precision The agreement between a set of samples or between duplicate samples.

 Relates to how close together the results are and is represented by

 Relative Percent Differrence.
- Surrogate Organic compounds that are similar in chemical composition, extraction, and chromotography to analytes of interest. The surrogates are used to determine the probable response of the group of analytes that are chemically related to the surrogate compound. Surrogates are added to the sample and carried through all stages of preparation and analyses.
- TIC Tentatively Identified Compound: Compounds detected in samples that are not target compounds, internal standards, system monitoring compounds, or surrogates.
