RE: JUNCTION BOX UPGRADE REPORT for 2006
EME SWD SYSTEM
Lea County, New Mexico

Mr. Price:

Rice Operating Company (ROC) takes this opportunity to submit the Junction Box Upgrade results for the year 2006. Enclosed is a list of the completed junction boxes and their respective closure/disclosure dates. These boxes are located in the Eunice Monument Eumont (EME) Salt Water Disposal (SWD) System. ROC completed 14 junction box sites in 2006. Junction box upgrades in 2007 will be conducted in conjunction with scheduled line replacements; 40 boxes are expected to be updated.

Enclosed are the 2006 results from the PID/BTEX study described in the NMOCD-approved Revised Junction Box Upgrade Work Plan (July 16, 2003). This comparison study is ongoing and data will continue to be collected in 2007. From the data collected thus far, no definitive conclusions can be drawn from the composite methods analyzed. A third-party analysis of ROC's 2006 chloride field tests compared to chloride laboratory analyses is also enclosed. The study of this data continues to validate the accuracy of the chloride field tests employed by ROC.

ROC is the service provider (agent) for the EME SWD System and has no ownership of any portion of the pipeline, well, or facility. The System is owned by a consortium of oil producers, System Partners, who provide all operating capital on a percentage ownership/usage basis.

Upgrade/closure projects of this magnitude require System Partner AFE approval and work begins as funds are received.

Thank you for your consideration of this Junction Box Upgrade Report for 2006.

Soil Chloride Measurement QA/QC: Comparison of Laboratory and Field Measurements¹

Objective and Scope

Rice Operating Company (ROC) evaluated soil chloride data from its junction box replacement program to determine how field measurements compared with laboratory measurements. A total of 112 measurements were taken from 45 sites over the period December, 2004 through December, 2006. Most (91) of the laboratory measurements were made by the Environmental Laboratories of Texas, with the remainder (21) being made by Cardinal Laboratories.

Results

Evaluation of the dataset reveals a good relationship between laboratory and field measurements of soil chloride concentrations (see graph, below).

Field soil chloride measurement thus provides a reasonable surrogate for laboratory measurement (which may be presumed to be closer to the true values), and the ability to distinguish between low and high levels of chloride contamination.

¹ Prepared by L. Peter Galusky, Jr. of Texerra.

2006 BTEX Study

Revised Junction Box Upgrade Plan (2003)

System: BD Date: 10/27/2005 Laboratory: Environmental
 Site: Hendrix Elliott EOL Sampler: Kevin Collins Lab of Texas

Location	PID reading (ppm)	FIELD COMPOSITE (mg/kg)			
		Benzene	Toluene	Ethyl Benzene	Total Xylenes
bottom composite at 12 ft BGS	599	0.00796	0.0980	0.257	1.18
		LAB COMPOSITE (mg/kg)			
		0.0142	0.515	1.83	4.893

Field PID tests <100 ppm are considered final for BTEX. If PID is >100 ppm, the components of the BTEX composite sample will be collected individually and will be composited under laboratory conditions to prevent excessive volatilization. A 15-box, 30-sample study will be made to compare field-compositing with lab-compositing BTEX samples. Composite components are collected in a skewed 'W' pattern.
