RE: **CORRECTIVE ACTION/CLOSURE REPORT**
Hobbs E-15 SWD site, #1R428-40
Unit E, Sec. 15, T19S, R38E

Mr. Hansen:

Rice Operating Company (ROC) respectfully submits the closure report by Arcadis of Midland, Texas for the emergency pit and redwood tanks at the referenced site. ROC discussed the Corrective Action Plan (CAP) for this site with you on July 18, 2007 at a meeting in Santa Fe. The Oil Conservation Division (OCD) granted conditional approval of the CAP via email on July 26, 2007.

Beginning August 9 and ending September 4, 2007, excavation of the site was conducted in accordance with the OCD-approved CAP. Two excavations were completed in the areas of concern and a compacted clay barrier was installed in each at 5 ft below ground surface. The remainders of the excavations were backfilled with compacted, blended soils and capped with quality topsoil. All surface facilities (including the caliche pad) associated with the plugged and abandoned SWD well have been removed and the entire facility surface has been spread with topsoil and compost material. This surface was seeded with a blend of native vegetation and is being monitored for growth.

Please accept this closure request and comprehensive report by Arcadis as documentation of the fulfillment of the CAP and OCD conditions. A copy of the final C-103 form, signed by the OCD District 1 Supervisor, for this site is also included with this submission. Should you have any questions regarding this report, please do not hesitate to contact me or Sharon Hall of Arcadis.

The SWD well at this facility was plugged and abandoned on February 6, 2002. Closure activities at the site began on June 25, 2007 in accordance with the NMOCD-approved Corrective Action Plan submitted by the consultants of Arcadis of Midland, Texas. Excavations at the former redwood tank and emergency pit sites were lined with a compacted clay barrier, backfilled with compacted, blended soils, and capped with quality topsoil. The facility's caliche pad was removed and the site was covered with quality soil and planted with a seed mixture of native vegetation.

The enclosed report from Arcadis provides additional information and documentation of the closure work completed at this facility.

I hereby certify that the information above is true and complete to the best of my knowledge and belief. I further certify that any pit or below grade tank has been/will be constructed or closed according to NMOCD guidelines , a general permit or an (attached) alternative NMOCD approved plan .

1.0 EXECUTIVE SUMMARY

The Hobbs SWD system is in the abandonment/restoration phase. The E-15 SWD well has been plugged and abandoned. Several tanks and a pit were historically used at the site. The tanks have been removed. The site is located Township 19 south, Range 38 east, north half of south half of northwest quarter of Section 15. Depth to groundwater at the site is approximately 60 feet below ground surface (bgs) based on regional data.

In a preliminary investigation in 2001, discrete geoprobe soil samples were collected at 5-foot intervals to a depth of 20 feet. Based on the results of the 2001 soil sampling analytical results, elevated chloride concentrations above 250 mg/kg were identified at the subject site, primarily located around the tanks and pit. Observed staining and odor indicated the possible presence of hydrocarbons; however, hydrocarbon concentrations were unknown.

An investigation and corrective action workplan was submitted to the New Mexico Oil Conservation Division (NMOCD) on August 30, 2004 by ARCADIS on behalf of Rice Operating Company (ROC). The NMOCD requested revisions to the workplan on December 20, 2004. On behalf of ROC, ARCADIS responded to the NMOCD with a letter addendum to the workplan on January 14, 2005.

As proposed in the workplan and addendum, investigation activities were conducted at the site in August and November 2005. A soil boring was drilled on August 26, 2005, and several trenches excavated and sampled on November 14th and 15th 2005. The water well inventory was conducted in conjunction with corrective action activities as proposed in the Corrective Action Plan (CAP).

2.0 SITE HISTORY AND BACKGROUND

The Hobbs SWD system is in the abandonment/restoration phase. The E-15 SWD well has been plugged and abandoned. Several tanks and a pit were historically used at the site. The tanks have been removed. The site location is shown in Figure 1 (Township 19 south, Range 38 east, north half of south half of northwest quarter of Section 15). Depth to groundwater at the site is approximately 60 feet below ground surface (bgs) based on regional data.

In a preliminary investigation in 2001, discrete geoprobe soil samples were collected at 5-foot intervals to a depth of 20 feet. Field chloride analysis was performed on the samples using field-adapted Method 9253. The samples were also inspected for the presence of staining and/or odor

Corrective Action
Closure Report

Based on the results of the 2001 soil sampling analytical results, elevated chloride concentrations above 250 mg/kg were identified at the subject site, primarily located around the tanks and pit. Observed staining and odor indicated the possible presence of hydrocarbons; however, hydrocarbon concentrations were unknown.

An investigation and corrective action workplan (ICP) was submitted to the New Mexico Oil Conservation Division (NMOCD) on August 30, 2004 by ARCADIS on behalf of Rice Operating Company (ROC). The workplan proposed conducting a water well inventory, drilling one soil boring and delineating and excavating soils based on model assumptions submitted in the workplan. The NMOCD requested revisions to the workplan on December 20, 2004. On behalf of ROC, ARCADIS responded to the NMOCD with a letter addendum to the workplan on January 14, 2005.

As proposed in the workplan and addendum, investigation activities were conducted at the site in August and November 2005. A soil boring was drilled on August 26, 2005, and several trenches excavated and sampled on November 14th and 15th 2005. The water well inventory was conducted in conjunction with corrective action activities as proposed in the Corrective Action Plan (CAP).

Vadose zone modeling for chlorides was performed using the Evapotranspiration Cover model as developed by Sandia National Labs (Alternative Landfill Cover Demonstration, Sandia National Labs). The model used the same input assumptions as the nearby Junction I-9 site and includes site specific data.

Based on model results for the proposed cap, the maximum allowable chloride concentration in soil is above 15,000 mg/kg assuming a groundwater chloride concentration of 100 milligrams per liter. The maximum concentration of chlorides in soil at the site is 4,660 mg/kg.

A Corrective Action Plan (CAP) was submitted to NMOCD on November 28, 2006 and approved on July 26, 2007. The CAP proposed the installation of Evapotranspiration Covers. Corrective action activities were conducted from August 9, 2007 through September 4, 2007.

ROC is requesting closure of this site as all approved Cap have been completed.

2.0 INVESTIGATION AND CORRECTIVE ACTION PLAN RESULTS

One soil boring was installed at the subject site to a depth of 40 feet bgs in the area that exhibited the highest chloride concentration. Soil samples were collected at five-foot intervals, screened in the field using a photoionization detector (PID) and field tested for chlorides. Soil lithology and the presence of any observed staining or odor was recorded. The deepest boring sample, collected at total depth of the boring, was submitted to a laboratory for laboratory analysis as confirmation of the field sampling. Chloride concentrations decreased with depth prior to reaching the saturated zone. No hydrocarbons were observed or were detected with the PID or in the sample submitted for laboratory analysis

Further investigation was conducted on November 14th and 15th 2005. Several trenches were excavated and sampled. Soil samples were screened in the field using a PID and field tested for chlorides. Soil lithology and the presence of any observed staining or odor was recorded. Sample locations and depth are shown on Figure 2. Field sampling analysis is shown in Table 1 and on Figure 2. No hydrocarbons were observed or were detected with the PID. Chloride impacts in soil have been delineated to a concentration of 250 mg/kg as requested by the NMOCD in an e-mail response (December 20, 2004) to the investigation workplan. Figure 2 summarizes the chloride analytical results.

3.0 APPROVED CORRECTIVE ACTION PLAN

Vadose zone modeling for chlorides was performed using the Evapotranspiration Cover model as developed by Sandia National Labs (Alternative Landfill Cover Demonstration, Sandia National Labs). The model used the same input assumptions as the nearby Junction I-9 site and includes site specific data.

Based on model results for the proposed cap, the maximum allowable chloride concentration in soil is above 15,000 mg/kg assuming a groundwater chloride concentration of 100 milligrams per liter. The maximum concentration of chlorides in soil at the site is 4,660 mg/kg.

A Corrective Action Plan (CAP) was submitted to NMOCD on November 28, 2006 and approved on July 26, 2007. The CAP proposed the installation of Evapotranspiration Covers in the locations shown on Figure 2. As shown in the Evapotranspiration Cover cap demonstration, the cover was proposed to be placed over the prepared, (ripped and graded) subgrade and the subgrade established to a 5% grade allowing run-off from the capped area. A 90 centimeter layer of native soil was proposed to be placed above the prepared subgrade and fifteen centimeters

of topsoil placed above the native soil. The proposal called for the capped area to be graded to a 5% grade allowing run-off and support of vegetation.

The NMOCD approved the CAP with the following conditions:

- 1) The excavated portion of the site (as specified in the CAP) shall be covered with at least one foot of clay (with a saturated hydraulic conductivity at or less than $1.0e-07$ cm / sec and compacted to 90% to 95% standard Proctor density) or a geosynthetic clay liner (GCL) (with a saturated hydraulic conductivity of less than $3.0e-09$ cm / sec). The subgrade shall be appropriately prepared to accept the clay (compacted) or GCL (compacted and free of stones greater than ½ inch in any dimension, protrusions, etc.).
- 2) The clay or GCL shall be covered with at least four feet of compacted (75% to 85% standard Proctor density) non-contaminated soil, including the background thickness of topsoil or at least one foot of suitable material to establish vegetation for the site.
- 3) The soil cover shall be constructed to the existing grade of the site and to prevent ponding of water and the erosion of the cover material.
- 4) Upon completion of closure, the excavated area shall substantially re-vegetate to the condition that existed prior to oil and gas operations and maintain the cover through two successive growing seasons, but not including noxious weeds.

A copy of the email approval of the CAP is included in Appendix A.

4.0 CORRECTIVE ACTION ACTIVITIES

Corrective action activities were conducted from August 9, 2007 through September 4, 2007. Cross sections detailed the cap construction are shown in Appendix C.

The North Excavation site covers 142 x 85 feet and was excavated to a depth of 5 feet. A 1-foot thick red clay layer was installed at the base of the excavation. The clay was compacted to a 92.5% to 93.6% standard Proctor density with a saturated hydraulic conductivity of $3.23e-08$ cm / sec. The next layer consists of 3 feet of blended composite backfill compacted to a 78.2% standard Proctor density. Above the back fill is a 1-foot layer of top soil. The surface was then covered with clean imported soil.

In total, 436 cubic yards (yds) of red clay, 539 yds of top soil, and 1339 yds of blended backfill were used in the North Excavation Site.

ARCADIS

Rice Operating Company
E-15 SWD
OCD Case # IR0428-40
Corrective Action
Closure Report

The South Excavation site covers an area of approximately 41 feet x 110 feet, and is also 5 feet deep. A 1-foot thick red clay layer was installed at the base of the excavation. The clay was compacted to a 95% standard Proctor density with a saturated hydraulic conductivity of $3.23e-08$ cm / sec. The next layer consists of 3 feet of blended composite backfill compacted to a 76.8% standard Proctor density. Above the back fill is a 1-foot layer of top soil. The surface was then covered with clean imported soil.

In total, 160 yards of red clay, 201 yards of top soil, and 501 yards of blended backfill were used in the South Excavation Site. The site was seeded with a reclamation seed mix purchased from Granite Seed Company located in Lehi, Utah.

3012 cubic yards of contaminated soil was shipped to the Sundance Disposal Facility located in Eunice New Mexico.

Site photographs are included in Appendix B.

Clay liner installation diagrams, engineering test reports, the backfill laboratory analytical report, seed mix specifications and soil disposal records are included in Appendix C.

In addition to the corrective action activities described in this report a ½ mile water well inventory report was performed per the approved CAP. The water well inventory report is included in Appendix D.

All CAP conditions as approved by the NMED on July 26, 2007 have been satisfied, therefore ROC requests closure of this site.

Subject: Approval for the CAP at the Hobbs E-15 site (OCD case #1R428-40)

Dear Ms. Haynes:

The NMOCD has reviewed the submitted Corrective Action Plan (CAP), dated November 28, 2006, for the above referenced site. The NMOCD hereby approves the CAP with the following conditions:

- 1) The excavated portion of the site (as specified in the CAP) shall be covered with at least one foot of clay (with a saturated hydraulic conductivity at or less than 1.0e-07 cm / sec and compacted to 90% to 95% standard Proctor density) or a geosynthetic clay liner (GCL) (with a saturated hydraulic conductivity of less than 3.0e-09 cm / sec). The subgrade shall be appropriately prepared to accept to the clay (compacted) or GCL (compacted and free of stones greater than ½ inch in any dimension, protrusions, etc.).
- 2) The clay or GCL shall be covered with at least four feet of compacted (75% to 85% standard Proctor density) non-contaminated soil, including the background thickness of topsoil or at least one foot of suitable material to establish vegetation for the site.
- 3) The soil cover shall be constructed to the existing grade of the site and to prevent ponding of water and the erosion of the cover material.
- 4) Upon completion of closure, the excavated area shall substantially re-vegetate to the condition that existed prior to oil and gas operations and maintain the cover through two successive growing seasons, but not including noxious weeds.

Also, please be advised that NMOCD approval of this plan does not relieve the owner/operator of responsibility should operations pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD approval does not relieve the owner/operator of responsibility for compliance with any OCD, federal, state, or local laws and/or regulations.

If you have questions regarding this matter, please contact me at 505-476-3489.

PLEASE NOTE: Liability and Damages. Cardinal's liability and client's exclusive remedy for any claim arising, whether based in contract or tort, shall be limited to the amount paid by client for analyses. All claims, including those for negligence and any other cause whatsoever shall be deemed waived unless made in writing and received by Cardinal within thirty (30) days after completion of the analytical service. In no event shall Cardinal be liable for incidental or consequential damages, including, without limitation, business interruptions, loss of use, or loss of profits incurred by client, its subsidiaries, affiliates or successors arising out of or related to the performance of services hereunder by Cardinal, regardless of whether such claim is based upon any of the above-stated reasons or otherwise.

GEOCHECK® - PHYSICAL SETTING SOURCE REPORT

TARGET PROPERTY ADDRESS

RICE OPERATING
122 W. TAYLOR
HOBBS, NM 88240

TARGET PROPERTY COORDINATES

Latitude (North):	32.66340 - 32° 39' 48.2"
Longitude (West):	103.142 - 103° 8' 31.2"
Universal Tranverse Mercator:	Zone 13
UTM X (Meters):	674239.3
UTM Y (Meters):	3615307.5
Elevation:	3601 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	32103-F2 HOBBS WEST, NM
Most Recent Revision:	1979

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u>	<u>FEMA Flood Electronic Data</u>
LEA, NM	Not Available

Flood Plain Panel at Target Property: Not Reported

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u>	<u>NWI Electronic Data Coverage</u>
NOT AVAILABLE	Not Available

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data:*

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bannock Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

PHYSICAL SETTING SOURCE MAP - 2056370.1s
