1.0 EXECUTIVE SUMMARY

Cornerstone Environmental Resources, Inc. (CERI) conducted an Environmental Assessment (EA) of the South Langley Jal Unit (SLJU) located in Lea County, New Mexico on January 18, 1999 at the request of and on behalf of Bristol Resources Corporation (Bristol). The property is located north of Jal as shown on the Location Map, Figure 1, and Topographic Map, Figure 2. CERI conducted this EA to evaluate the extent of a brine water spill from a leak in an injection line on the subject property. A report was prepared documenting the findings and submitted to the New Mexico Oil Conservation Division's (NMOCD) Hobbs office. Ms. Donna Williams, an environmental engineer with NMOCD, requested additional information be obtained. She requested the following:

1. Bristol Resources demonstrate that any remaining water contaminant will not impact groundwater or environment.
2. Bristol Resources perform Vertical and Horizontal delineation by sampling for BTEX, TPH, and Chlorides.

The purpose of this phase of the study was to respond to Ms. Williams request and further delineate chloride contamination in the subject area. Six soil borings were advanced to depths of 20 to 25 feet to further delineate the chloride concentrations in the area. The soil borings found high chloride concentrations present in the study area at depths of 20 to 25 feet. We do not know at this time if the high chlorides are from the spill from the leak reported in January 1999 are from historical spills in the area.

BTEX above the detection limit of 20 ug/kg was not detected in any of the samples analyzed. There was a TPH diesel range measurement 11.1 mg/kg in the near surface sample of Well #3. There was a TPH gasoline range measurement of 1.12 mg/kg in the near surface sample in Well #6. The other measurements were below the detection limit of 1 mg/kg.

We recommend that a well be drilled to recover a ground water sample and evaluate the ground water quality in the area. We recommend a well location to the south of Well #1 or to the east of Well #2. Other water wells in this area have reported ground water depths of 53 feet and a well in this location should encounter water at approximately this depth.

2.0 INTRODUCTION AND PURPOSE

CERI conducted an EA of the SLJU located in Lea County, New Mexico on January 18, 1999 at the request of and on behalf of Bristol. The property is located north of Jal as shown on the Location Map, Figure 1, and Topographic Map, Figure 2. CERI conducted this EA to evaluate the extent of a brine water spill from a leak in an injection line on the subject property. A report was prepared documenting the findings and submitted to the NMOCD Hobbs office. Ms. Donna Williams, an environmental engineer with NMOCD, requested additional information be obtained. She requested the following:

1. Bristol Resources demonstrate that any remaining water contaminant will not impact groundwater or environment.
2. Bristol Resources perform Vertical and Horizontal delineation by sampling for BTEX, TPH, and Chlorides.

The purpose of this phase of the study was to respond to Ms. Williams request and further delineate chloride contamination in the subject area. The study area is located in the NW Section 18 and the SE Section 7, T25S R37E where a salt water leak was reported between Producing Well #9 and Injection Well #13. The leak occurred in the injection line going to Injection Well #13. Figure 2 shows the two wells and the study area between them.

Trenches dug with a backhoe were used to obtain samples in the January study. A truck mounted drill rig was utilized in this phase to obtain core samples for analysis.

3.0 AQUIFER AND PRODUCED WATER CHARACTERISTICS

3.01 Groundwater

The spill occurred in the NE ¼ of Section 18, R37E, T25S. Mr. Ken Frequez with the State Engineer's office was contacted concerning the depth of ground water in the area. He said there were two water wells in the area. These wells and the depth to ground water are as follows in Table 1.

Table 1

Location	Water Depth	Surface Elevation
NW ¼ Sec 17, T25S, R37E	53 ft.	3104 ft.
SE ¼ Sec 18, T25S, R37E	53 ft.	3107 ft.

Based on water depth in these two wells, the depth of ground water in the area is 53 ft.

3.02 Produced Water

A sample of the injection water was taken on 2/5/99 and analyzed by Martin Water Labs., Inc. The results of the analysis is presented in Appendix A. The chloride concentration in the injection water based on this sample is 26,270 milligrams per liter (mg/L).

4.0 DATA GATHERING AND SAMPLING

Well bores were advanced using a 6 inch hollow-stem auger. A 5 foot split spoon sampler was used to collect cores. An attempt was made on the first well to utilize a probe with a plastic sleeve to obtain core samples. A point of refusal was reached at approximately 8 feet when a hard lime interval was encountered. The probe was abandoned in favor of the auger. A total of 6 wells were advanced in this phase of the study. The locations of the wells in this study and the trenches dug in January, 1999 are shown on Figure 3.

Photo 1 shows the location of Well #1 soil boring. This well was located south of the previously identified surface disturbed area. There was no evidence of surface disturbance at this location. The other well sites are shown in Photos 2 through 6. Well #3 was placed in the surface disturbed area and Well #2 and #6 were placed to the east and west of the area. Wells #4 and #5 were placed to the east of previously dug trenches.

The original plan was to drill all wells to 20 feet. The actual drilled depth ranged from 20 feet in Well #4 to 25 feet in Well #6. The wells were plugged with bentonite and cuttings from the well following the coring.

5.0 SAMPLE ANALYSES AND DISCUSSION

Core diagrams for each of the wells were prepared and are shown on Figure 4. The section line for Figure 4 is shown on Figure 5. The well logs show the sample number and chloride concentration on the left side of the log. The lithology is shown on the right side. A copy of the lab analysis is contained in Appendix A.

Chloride contamination was not detected in the near surface at Wells #1, #2 and #4. High chloride concentrations were detected in the near surface in Well #3 located in the surface disturbed area and in Well #6 located to the west of the surface disturbed area. Elevated chlorides were also found in Well #5.

There were sand stringers and zones of broken lime found at depths between 8 to 15 feet. Elevated chlorides were detected in all of the wells but Well #2.

A pink to red sand was found in the 20 to 25 foot interval in Wells #1, #3, and #6. A soft lime was encountered in the other wells at about 20 feet. All of the wells at this depth had high chloride concentrations in the sand and the lime.

Photo 7 shows cores 1 and 2 from Well #1. The brown sand overlying the caliche zone can be seen in this photo. The hard lime sections with broken section is shown in Photo #8 which is a photo of Core #2 from Well #3. The red sand at the 20 foot level is shown in Photo #9 which shows Core #5 from Well #5.

BTEX above the detection limit of 20 ug/kg was not detected in any of the samples analyzed. There was a TPH diesel range measurement 11.1 mg/kg in the near surface sample of Well #3. There was a TPH gasoline range measurement of 1.12 mg/kg in the near surface sample in Well #6. The other measurements were below the detection limit of 1 mg/kg.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Soil borings show that high chloride concentrations are present in this area at depths of 20 to 25 feet. We do not know at this time if the high chlorides are from the spill from the leak reported in January 1999 are from historical spills in the area.

We recommend that a well be drilled to recover a ground water sample and evaluate the ground water quality in the area. We recommend a well location to the south of Well #1 or to the east of Well #2. Other water wells in this area have reported ground water depths of 53 feet and a well in this location should encounter water at approximately this depth.

Dear Mr. Alderman:

Enclosed are the analytical results for your project referenced above. The following samples are included in the report.

9003001 A,B,C :264904	9003002 A :264905
9003003 A :264906	9003004 A,B,C,D :264907
9003005 A :264908	9003006 A :264909
9003007 A :264910	9003008 A,B,C,D :264911
9003009 A :264912	9003010 A,B,C,D :264913
9003011 A,B,C,D :264914	9003012 A :264915
9003013 A :264916	9003014 A :264917
9003015 A,B,C,D :264918	9003016 A :264919
9003017 A :264920	9003018 A,B,C,D :264921
9003019 A,B,C,D :264922	9003020 A :264923
9003021 A :264924	9003022 A,B,C,D :264925
Trip Blank :264926	

All holding times were met for the tests performed on these samples.

Our A2LA accreditation requires that, should this report be reproduced, it must be reproduced in total.

Enclosed please find the Quality Control Summary. All quality control results for the QC batch that are applicable to this sample(s) are acceptable except as noted in the QC batch reports.

If the report is acceptable, please approve the enclosed invoice and forward it for payment.

Thank you for selecting Core Lab - Gulf States Analytical to serve as your analytical laboratory on this project. If you have any questions concerning these results, please feel free to contact me at any time.

----- Result Footnotes -----

(M) - QC Sample Was Reanalyzed

(A) - Matrix Interference

(B1) - Sample(s) rerun to confirm matrix interference.

(D) - Surrogate is diluted out

----- Batch Notes -----

NOTE: The matrix of the sample 50739 caused the spike and spike duplicate to be high, so a bench spike of the sample itself was analyzed and reported also.

----- Result Footnotes -----

- (I1) - Matrix spike outlier due to compound over calibration range.
 (3a) - Duplicate is valid because the result is less than 5 times the LOQ
